

Differences between commercial IoT PaaS platforms and Kaa

	IoT PaaS	Kaa IoT
Code control	Proprietary and opaque	Open source and transparent
Cost	Annual fee + usage fee + service + support	Service + support
Scalability and security	Limited visibility and control	Full visibility and control
Talent attraction	Challenging due to the proprietary nature of the platform	Straightforward on account of being open source and the reuse of proven and widely adopted open source components
Professional services	Expensive, shared, on-demand resources	Dedicated team; proven and cost-efficient offshore methodology

communication across connected objects, including data consistency and security, device interoperability and failure-proof connectivity.

The Kaa server features well-established interfaces for integration with data management and analytics systems, as well as with product-specific services. It acts as a foundation for the backend system that you are free to expand and customise to meet the specific requirements of your product.

Why use Kaa?

The following features make Kaa different from other middleware platforms used to build IoT solutions:

1. 100 per cent open source and free.
2. Reduces the development time from months to weeks.
3. Is rapidly evolving, with new features being added for free.
4. Pre-integrated with data management systems.
5. No single point of failure.
6. Easily tailored for any business application.
7. Minimises the costs and risks of application development.
8. Straightforward hardware integration procedure.
9. Handles millions of devices and scales elastically.
10. Significantly reduces development time by providing an advanced, out-of-the-box IoT features set.
