

Canonical brings Kubernetes 1.6.2 support to Ubuntu and Mac OS

Canonical has announced the support for Kubernetes 1.6.2. The latest development is designed specifically for the Canonical distribution of Kubernetes and the Kubernetes Charms.

In the latest release, Canonical has improved Kubernetes Charms and added support for Snaps to the kubernetes-e2e Charm. The

Kubernetes-master layer has also received newly added namespace- (list, create, delete) actions. Also, the Microsoft Azure cloud computing platform now has the clifs-utils package in kubernetes-worker. "This is the pure upstream distribution of Kubernetes, built with operators in mind," Canonical engineering manager Marco Ceppi wrote in the official release note.

The release allows operators to deploy, manage and operate Kubernetes on a public cloud, on-premise, on bare metal as well as on developer systems. There are also bug fixes and patches to deliver an improved operational experience.

Alongside the fixes, Canonical has enhanced the Kubernetes performance through a fresh Juju status update. There is also an added option of '-delete-local-data' to pause. Besides, the new Kubernetes version has updated readme files in the kubernetes-master.

of more than US\$ 250 million for building original VR content. Oculus has now set aside US\$ 50 million from the proposed funding amount to invest exclusively on non-gaming, experimental VR content. "This money will go directly to artists to help jumpstart the most innovative and groundbreaking VR ideas," Rubin stated.

This is not the first time that VR is exploring open source options. Platforms like StreamVR and Google's Daydream VR have also opted for community moves to gain in the market. Last month, Facebook even launched its JavaScript framework, React VR, to boost the progress around simulation and immersive experiences.

Cinnamon 3.4 debuts with notable changes

After much anticipation, Cinnamon 3.4 has finally been released. The latest desktop environment includes changes that will be included by default within the Linux Mint 18.2.

Cinnamon 3.4 comes with over 160 new changes. You can expect a few more bug fixes and patches before the desktop environment arrives in the stable channels of various Linux distros.

The latest version offers a cinnamon-stap-monitor utility and better panel interlithide. A noteworthy addition is the ability to manage the systemd services in the distro. Another notable tweak is a 'Run now' button that appears while you select a row in Cinnamon's *Settings* module. It eases the management of startup applications.

Besides, the desktop environment will no longer display the applets that do not offer vertical panels. You can also easily configure the LightDM login manager using lightdm-settings in the Cinnamon *Settings* module.

The new Cinnamon release displays critical notifications in full-screen mode. The team has also fixed the panel launcher animation, and users can control the acceleration and sensitivity of the mouse pointer.

GNU Compiler Collection gets anniversary update

GNU Compiler Collection (GCC) has received an update to 7.1.0. The new version marks the 30th anniversary of GCC.

The GCC 7.1.0 update is a major release for the open source community as it comes with several new functionalities. "This year, we celebrated the 30th anniversary of the first GCC beta release, and this month we will celebrate 30 years since the GCC 1.0 release," GCC developer Jakub Jelinek wrote in an official announcement.

The latest version brings experimental support for the C++17 draft library in the C++ frontend. There are also a few additions in the libstdc++ library. The GCC team has included the `std=gnu++1z` and `-std=c++1z` options as well.

Further, GCC 7.1 gets support for Address Sanitizer to report the use of variables. There are also improved versions of the optimisers to add new functionality in the link time optimisations.

Alongside the major tweaks and changes, the GCC update has the ability to configure OpenMP 4.5 offloading for Nvidia PTX GPUs. Tools like stink wrapping, code hosting and loop splitting have also been enhanced in the new version.

You can download the official source tarball of GCC 7.1.0 and compile the
