

version for your Linux distro. The stable repository for the respective distros will be available soon.

India IT infrastructure spending to reach US\$ 2.2 billion in 2017: Gartner

The expenditure on IT infrastructure in India is expected to reach US\$ 2.2 billion in 2017, according to research firm Gartner. Segments like enterprise networking and storage are expected to register growth while the spending on server equipment is expected to decline.

Gartner predicts that the overall IT infrastructure spending in the country will increase by 1.5 per cent over 2016. The prime factor behind the growth is touted to be the digital transformation that was kickstarted right from the government level — with the launch of public initiatives like ‘Digital India’ and ‘Make in India’.

“Digital transformation is bringing in new sets of challenges and opportunities for Indian infrastructure leaders,” said Naveen Mishra, research director at Gartner, in a statement. “They have the unique opportunity of being at the helm of this shift within their organisation, provided they align with the imperatives of the digital world,” he added.

Swift increase in the demand for cloud computing has made enterprise networking the ‘biggest segment’ within the entire Indian IT infrastructure market. The firm predicts that revenue from the enterprise networking segment will reach US\$ 1.1 billion in 2017.

After enterprise networking comes the storage segment that is expected to reach US\$ 352 million. Gartner believes that the small increase in revenue from US\$ 346 million in 2016 will be primarily driven by technology alternatives such as software-defined storage (SDS) and Flash-based storage.

In the entire Indian IT infrastructure market, server spending is predicted to fall. Gartner expects that the spending on server equipment will decline from US\$ 765 million in 2016 to US\$ 727 million in 2017.

Despite the decline in 2017, server spending is likely to receive a marginal boost in 2018 and reach US\$ 768 million. New developments like the advanced Linux distributions are expected to play a vital role over time.

Google develops a DIY kit to make Raspberry Pi smarter

Raspberry Pi Foundation has partnered with Google to launch a special DIY kit that comes bundled with the MagPi 57 magazine, and is designed to enable Raspberry Pi to build solutions around Amazon Echo and Google Home.

Called the ‘Artificial Intelligent Yourself’ (AIY), the kit comes with a Google Voice Hardware Attached on Top (HAT) accessory board and includes components such as a stereo microphone, large arcade button and a selection of wires. Google has also provided

its iconic cardboard case that houses the entire kit in a neat and clean form — similar to Google Cardboard.

Google patches critical flaws in Android through May update

Google has finally released its May security update for Android. The new update addresses more than 100 vulnerabilities.

The security fixes are split into two patch levels—2017-05-01 and 2017-05-05. The latest Android update addresses 29 critical flaws in hardware-specific drivers, media processing servers and similar components.

In the list of patches and fixes, the 2017-05-01 version covers bugs and vulnerabilities that are common across all Android devices while the 2017-05-05 patch level has fixes for vulnerabilities in hardware-specific drivers and components. Notably, the May update has patched as many as six critical vulnerabilities in Mediaserver.

Mediaserver has been full of flaws for many years. Though Google attempted to patch it several times in the last few years, it was until now relatively easy to trick users to download vulnerable media files and then exploit their devices using Mediaserver flaws. Attackers were even able to gain remote access to the device for code execution using the Mediaserver process.

Ultimately, Google has disabled many channels that could help attackers exploit the Mediaserver offering.

Google has primarily released the May update package for its flagship Pixel and Nexus devices. The relevant patches for Android Open Source Project (AOSP) are available. Further, Users need to wait until manufacturers compile the update for their devices.
