

is a hack to do that:

```
docker stop $(docker ps -q)
```

You may have to use *sudo* before *docker* both times in the command. This can save you from individually stopping dozens of containers before a system shutdown.

Swing between 'smart quotes' and 'straight quotes' in LibreOffice

Those who have been hunting around for a way to quickly use both smart and straight quotes on any PC running LibreOffice or OpenOffice, here's the way to go about it.

Turn on *Smart quotes* (if turned off) using *Tools » AutoCorrect Options » Localized Options*.

Hit *Ctrl+z* (or *Undo*) to turn back curly quotes to straight quotes following each individual insertion.

I tested this on LibreOffice, and expect equal success with OpenOffice.

Adding the time stamp to the History command

The *History* command does not output the time stamp with the log of the most recently executed commands.

To do so, run the following command in the terminal:

```
# HISTTIMEFORMAT="%d/%m/%y %T"
# history
```

If you want to permanently append this change, add the following line to the *~/.bashrc* file:

```
# export HISTTIMEFORMAT="%d/%m/%y %T"
```

Then, from the terminal, run the following:

```
# source ~/.bashrc
```

Here's an explanation of the commands and switches:

history – GNU History library

HISTTIMEFORMAT – Environmental variable

%d – Day

%m – Month

%y – Year

%T – Time stamp

source – In short, send the contents of the file to the shell
.bashrc – Is a shell script that BASH runs whenever it is started interactively

Add a welcome message to your terminal

This tip will show you how you can easily add a

welcome message to your terminal. This message will be displayed at the start, whenever you open your terminal.

Here are the steps to follow:

1. You need to install *figlet*. So open the terminal and type the following command:

```
sudo apt-get install figlet
```

Then press *Enter*.

2. Open *.bashrc* in the Vim editor and press *''* to get into *Insert* mode.

```
vi .bashrc
```

3. Enter the following command in *.bashrc*:

```
figlet -c your_message
```

Press the *Esc* button; then press *colon* *x* and *Enter*.

4. Now, when you open your terminal, you can see your welcome message.

Here is another tip that I want to share.

Remove Amazon results from Dash in Ubuntu

Ubuntu added Amazon search results into the Unity Dash a few releases ago. While many people complained that their privacy was at risk since every search was being sent to Amazon's servers, I personally just found the Amazon results unnecessary.

To remove the Amazon search results from the Dash, run the following command:

```
sudo apt-get autoremove unity-lens-shopping
```

...and restart. This will get rid of the Dash lens that is responsible for those results.

Alternatively, you can also go into the *System Settings* → *Security & Privacy*, and disable *Online Search Results*. Do note that this toggle will affect not just the Amazon search results, but also any other Dash lenses that require the Internet to function.

Share Your Linux Recipes!

The joy of using Linux is in finding ways to get around problems—take them head on, defeat them! We invite you to share your tips and tricks with us for publication in *OSFY* so that they can reach a wider audience. Your tips could be related to administration, programming, troubleshooting or general tweaking. Submit them at www.opensourceforu.com. The sender of each published tip will get a T-shirt.
