

It was all about the future of containers at the Bangalore Container Conference

Bangalore Container Conference (BCC), held on April 7 at Bengaluru, was India's first conference focused on container technologies, and attracted more than 250 delegates.

"Containers are eating the world. It has been Docker, Docker, everywhere for the last few years," said

Hari Kiran, one of the organisers of the Bangalore Container Conference (BCC) and co-founder of CodeOps Technologies.

When asked about what prompted him to conduct an event like BCC, Kiran told *Open Source For You*, "Given the fact that there is substantial interest in container technologies among developers in India, we realised that the time is ripe for organising India's first conference on this topic."

All the tickets for BCC 2017 were sold out a month before the conference date. The conference hosted Evan Powell, chairman of OpenEBS, and Ian Lewis, developer advocate at Google, who travelled from the US and Japan, respectively. Both the experts were featured at the keynote sessions.

In his opening address, Powell spoke about the relationship between DevOps and containers. He explained how the DevOps industry is expected to significantly benefit from the container ecosystem and its technologies.

Lewis began his keynote on 'standards-based containerisation with Kubernetes' and explained why standards are important. He elaborated on how they allow interoperability between systems and the right level of abstraction at each part of the stack.

Organisations are increasingly adopting containers and related technologies in production and want to learn from others' successes, failures and best practices. Hence, the theme chosen for the conference was 'Containers in production'.

Following the talks by the experts, there was a panel discussion on using containers in production. The conference also featured two workshops. *Open Source For You* was the media partner for the event.

Microsoft fixes OneDrive performance issue on Linux

Microsoft has finally fixed the infamous OneDrive performance issue that was

widely reported by Linux users. The slow access to OneDrive on Linux-based distros had downgraded the experience for many on the open source platform.

The performance issue was due to a forced Windows user-agent string on Chrome and Firefox based browsers on Linux. Some users even felt that

Microsoft was deliberately causing performance hiccups for Linux users.

Red Hat Gluster Storage 3.2 lowers data integrity costs

Red Hat has announced the new version of Gluster Storage 3.2. The update comes preloaded with several performance improvements as well as deeper integration with Red Hat OpenShift Container Platform.

Focusing on performance improvements, Red Hat Gluster Storage 3.2 provides data integrity at a lower cost. There is enhanced integration with OpenShift Container Platform that brings native support for advanced storage services like geo-replication and in-flight encryption for applications deployed in containers.

"Red Hat Gluster Storage 3.2 marks a milestone in the life of the product. It brings together a number of innovations that are relevant to the modern CIO," said Ranga Rangachari, vice president and general manager of storage, Red Hat.

Red Hat claims that the upgraded OpenShift Container Platform support can enable three times as many persistent volumes per cluster. The newly added improvements also offer a smaller hardware footprint through arbiter volumes and shrink infrastructure costs while maintaining data integrity. They also fix the problem of data mismatch between two nodes.

Customers running traditional NAS use cases for backup/restore can achieve data integrity, while hyper-converged configurations in branch offices can save on hardware costs, power and data centre space. The software package also comes with the Nagios framework to monitor storage operations.

The latest Gluster Storage version has also fixed to scale metadata-intensive operations for large files. Red Hat believes that faster metadata-intensive operations can improve daily operations by 8x. The new release is focused on the software-defined storage industry.
