

- `dart:web_sql` - This provides an API for storing the data, which can be manipulated with SQL.

Dart 'pub'

The package manager of Dart is called 'pub'. The Dart applications specify the 'pubspec', which lists the dependencies for that application. For example:

```
name: my_app
dependencies:
js: ^0.3.0
intl: ^0.12.4
```

After the specification of 'pubspec', navigate to that directory and execute 'pub get' as shown below:

```
cd <path-to-app>
pub get
```

The dependencies can be upgraded later with the following command:

```
$ pub upgrade
```

The Dart tools

In this article, the code written in Dart is executed using DartPad. However, as stated earlier, for advanced tasks, it would be better to have an IDE installed in the local machine. The official documentation has recommended the WebStorm IDE.

In the case of Web app development, the Dartium browser can be used. The Dartium browser download is available in the link: <https://webdev.dartlang.org/tools/dartium>.

Apart from the Dartium browser, the other command line

tools such as `pub build` (for building a Web app) and `pub serve` (for serving a Web app) can also be used.

There are a few other important Dart tools such as:

- Dartanalyzer - This tool is used to evaluate and report potential errors in your Dart code.
- Dartfmt - This tool is for formatting the Dart code. The official Dart style guide is followed while formatting the code.

To summarise, Dart is an interesting programming language with features to facilitate Web, mobile and command line apps. Its major advantages are its stability and support base. The SDK is constantly updated and, at the same time, is very stable. In the case of Web applications, the combination with AngularDart makes it a very powerful tool. The mobile application development platform, Flutter, enables the building of apps for both Android and iOS from the same codebase. Overall, Dart is a programming language that is easy to learn, and it enables the developer to build various types of apps.
