

Microsoft has responded to a thread in Hacker News announcing the fix. According to Edgar Hernandez from the OneDrive team, the StaticLoad.aspx page that pre-fetches resources in the background for Office apps was a less efficient technique causing the earlier-mentioned issue. He also clarified that the issue was not intentional.

"The pre-fetching optimisation was disabled, and it will be enabled again soon after an update for StaticLoad.aspx has been tested on Linux and released. We apologise for the inconvenience this may have caused," Hernandez wrote.

Alongside announcing the fix, Hernandez promised thorough Linux testing in the future. Microsoft apparently wants to make sure that OneDrive is a productive service for as many users as possible.

SAP joins Hyperledger Project to embrace open source blockchain developments

SAP SE, the company known for its proprietary enterprise software offerings, is finally moving on the open source path and has joined the Hyperledger Project as a premier member. The new development will allow SAP to utilise the advanced blockchain technology driven by open source collaboration.

As a part of the new collaboration, Dominik Heere, vice president of innovation engineering, SAP Innovation Centre Network, will represent SAP's content on the Hyperledger governing board. Based in Walldorf, Germany, SAP is set to enable blockchain technology in "existing and new business scenarios" for its enterprise

clients through the Hyperledger Project. The community-driven blockchain developments will be implemented across SAP's entire portfolio, including the SAP Ariba network.

"In joining Hyperledger, we plan to share our expertise and knowledge to help bring open distributed ledger technology

to all businesses," said Juergen Mueller, chief innovation officer, SAP, in a joint statement. "We believe blockchain is a transformative technology for enterprise businesses. We are committed to advancing its adoption via the creation of new standards, use cases, platforms and open applications," he added.

Led by the Linux Foundation, the Hyperledger Project aims to develop a model of a commonly distributed ledger that lets organisations build and run industry-specific applications, platforms and hardware systems to support their industry's business transactions. More than 122 members have already joined the project, which is what seems to have persuaded SAP to also do so.

"Having support from an enterprise software and cloud leader like SAP is an important step in the right direction. The diversity of our members is a real strength, as we look to advance open blockchain technology POCs, pilots and production deployments across many industries this year," said Brian Behlendorf, executive director, Hyperledger.

SAP is planning to enable use cases like provenance scenarios, digital object representations and collaborative transaction executions.

IBM also recently joined the Hyperledger Project to enter the growing blockchain space. The IT giant has announced its own blockchain ecosystem called the IBM Blockchain that is backed by the collaborative consortium.

Infosys embraces open source, joins network community

Indian IT services giant, Infosys, has joined the Open Invention Network (OIN) as a community member. The new move will enable the Bengaluru-headquartered company to share its developments with over 2,000 member companies in the OIN community, which is funded by Google, IBM, NEC, Philips, Red Hat and SUSE.

"We appreciate Infosys' leadership in joining OIN and believe that those who look to the company for inspiration, both in and outside of India, will see the wisdom it has demonstrated by supporting patent non-aggression in Linux and adjacent open source technologies," said Keith Bergelt, CEO of Open Invention Network.

Infosys considers open source software as the 'primary engine of innovation' that will help boost areas such as cloud computing, Big Data, artificial intelligence, DevOps and modern Web frameworks. Joining OIN will be vital for the company to expand its IT presence by not just sharing its developments with other community members but also enabling it access to the intellectual property of member companies without paying a royalty fee.

"Infosys is actively taking open source and open source based products to all our enterprise customers, so we are extremely excited to become a part of OIN. We encourage others to join it as well and support this very important initiative," said Navin Budhiraja, SVP and head, architecture and technology, Infosys.

North Carolina-based OIN is the leading patent non-aggression community to promote the deployments of Linux and other related open source technologies. Patents owned by the OIN community are licensed royalty-free to help companies expand and enhance their existing offerings and promote open source.

Prior to Infosys, German automaker Daimler had joined OIN. The parent company of Mercedes-Benz is aiming to leverage open patents to upgrade intelligent vehicle technologies.
