

designers should use HTML5 tools, which are a great help when one needs to set up workflows/websites or perform repetitive tasks. They improve the usability of Web designs. Featured below are some essential tools which help in creating amazing websites.

HTML5 Maker: This is used to interact with content in websites with the help of HTML, JavaScript and CSS. It is very easy to use. It also allows us to develop slide shows, sliders, HTML5 animation and more.

Liveweave: This is used to test the code. It cuts down on the time spent on saving the code and loading it on screen. Pasting the code in the editor gives instant results. It is very easy to use and also provides the auto-complete feature for some of the code, which makes development and testing faster and easier.

Font dragr: This previews the custom Web fonts in a browser. It loads the font instantly, so you get to know whether it looks good or not. It also offers a drag-and-drop interface, allowing you to drop your typefaces, Web open fonts and vector graphics to test all of them immediately.

HTML5 Please: This allows us to find anything related to HTML5. If you want to know how to use any feature, you can search for it on HTML Please. It provides lists of useful resources about supporting browsers and devices, syntax, general recommendations of how to use the element, etc.

Modernizr: This is an open source tool which is used to provide the best experience possible, given the visitor's browser. With this tool, you can detect whether the visitor's browser supports HTML5 features, and load the scripts accordingly.

Adobe Edge Animate: This is a useful tool for HTML5 developers who have to deal with interactive HTML animations. It is used in digital publishing, the Web and in the advertising fields. This tool allows users to create flawless animations, which run across multiple devices.

Video.js: This is a HTML5 video player based on JavaScript. If you want to add videos to your website, you should use this tool. It makes videos look good and a part of the website.

The W3 Validator: The W3 Validator tests the validity of the markup of websites in HTML, XHTML, SMIL, MathML, etc. To test the markup validity of any website, you have to choose the document type as HTML5 and enter your Web page's URL. By doing this, your code will get checked, and all errors and warnings will be mentioned.

HTML5 Reset: This tool allows developers to rewrite the code of their old websites in HTML5.

You can use these tools to provide a great Web experience for visitors to your website.
