Lazarus IDE

Lazarus IDE was developed by Cliff Baeseman, Shane Miller and Michael A. Hess in February 1999. It is regarded as a cross-platform GUI based IDE for rapid application development, and it uses the Free Pascal Compiler. It inherits three primary features—compilation speed, execution speed and cross-compilation. Applications can be cross-compiled from Windows to other operating systems like Linux, Mac OS X, etc.

This IDE consists of the Lazarus component library, which provides varied facilities to developers in the form of a single and unified interface with different platform-specific implementations. It supports the principle of 'Write once and compile anywhere'.

Features

- Powerful and fast enough to handle any sort of source code, and supports performance testing.
- Easy to use GUI, which supports drag-and-drop components. Additional components can be added to the

IDE through Lazarus package files.

- Makes use of Free Pascal, which is highly enhanced with new features and is even used in Android app development.
- Highly extensible, open source and supports various frameworks to compile additional languages.
