

upgraded experience. There are new notification channels that work to enable app-defined categories for notification content. The operating system also works with auto-fill APIs to add login details and repetitive information automatically to certain forms.

The Android O additionally includes some root-level changes to improve the existing user experience. There are font resources in XML as well as adaptive icons and a wide gamut of colour capabilities for apps.

Google has also provided a large number of Java 8 language APIs and runtime optimisations to take on other mobile platforms including iOS. You can download the very first Android O Developer Preview on your Nexus or Pixel device. The new version comes with an updated SDK to make development even easier. Moreover, an emulator has been specifically designed to test Android Wear 2.0 apps on Android O.

A manual download and Flash is currently the only available channel to install the O release on compatible devices. But you should only install the preview to test your development skills, as some hidden bugs can affect the performance of your device.

Orgs, the team collaboration software from npm, becomes free for open source developers

npm Inc., the parent company of Node.js, has announced that it has made its developer collaboration tool free for open source projects. Called Orgs, the tool is popular among JavaScript and Node.js developers.

The free version is only available for open source projects. But those using Orgs for private packages still need to opt for the premium subscription of US\$ 7 per month/per user.

npm has decided to offer the free version to support development in open source. "Making it easier to collaborate on open source projects benefits the whole community, because anything

that reduces friction in software development makes it easier for everyone to build amazing things," said Isaac Z. Schlueter, CEO of npm Inc., in a statement.

With this development, open source teams can now use advanced capabilities like role-based access control, package search and semantic versioning for free. npm can simplify the particular kind of dependency between two software packages or modules in any project. Besides, Orgs can help users share and manage code packages among team members.

Netflix debuts on Linux with HTML5 video playback

A long time after its arrival on proprietary platforms, media streaming service Netflix has finally arrived on Linux. Mozilla's Firefox browser has received Netflix's official support to play premium HTML5 content.

While Google Chrome had enabled Netflix video playback support on Linux back in 2014, Firefox has become the first Web browser to deliver premium video content in HTML5 on the open source operating system.

"Starting today, users of Firefox can also enjoy Netflix on Linux. This marks a huge milestone for us and our partners, including Google, Microsoft, Apple and Mozilla, that helped make it possible," the Netflix team, comprising engineers Nicholas Eddy, Matt Trunnell and Kevin Gallagher, reported in a recent blog post.

In 2013, Netflix added HTML5 support for premium videos to deliver an improved experience over the previously supported Silverlight. It also omitted the need for plugins to enable video playback.

LibreELEC adds support for Raspberry Pi Zero W

The Linux community has received a new LibreELEC update that comes with native support for Raspberry Pi Zero W. The latest release also comes with a new Kodi version.

Dubbed as LibreELEC 8.0.1, the new version is specifically designed to upgrade the experience across a variety of hardware. The very first noticeable change in the update is the support for Raspberry Pi Zero W, which was recently launched with wireless connectivity options.

Additionally, the LibreELEC team has provided improvements for the Raspberry Pi 3 board. You can experience the improved software HEVC decoding, as well as support for Fe Pi audio cards and Cirrus Logic DAC. Users opting for the Kodi media player can also enjoy the advantage of the new maintenance release and receive its fresh build with fixes to upgrade the user experience.

The LibreELEC 8.0.1 release includes Linux 4.9.13 on generic, Raspberry Pi and Raspberry Pi 2 devices. However, on the Amlogic aarch64, the update comes with the dated Linux 3.14 kernel.

You can download LibreELEC 8.0.1 directly from the official LibreELEC website. It can be installed through an SD card or a USB drive.
