

As Bryce stated, the Newton version provides an enhanced resilience to empower worldwide organisations with the cloud. There are projects like Cinder, Neutron, Trove and ironic to provide high availability functionality. Likewise, the OpenStack Foundation has brought out some notable security improvements and enhancements to support various deployments.

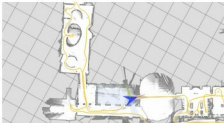

Magnum, which comes as an API service to offer deployment and management options to container orchestration tools like Docker Swarm, Kubernetes and Mesos, has also included features like the operator-centric Install Guide, support for pluggable drivers and Kubernetes clusters on bare metal servers.

Originally launched in 2010, OpenStack is backed by more than 200 vendors so far. This growth gave a reason to the non-profit organisation to design its latest version with the help of over 2,500 experts from around 300 organisations.

Existing users can test the same variant through OpenStack-powered distributions in the near future. Meanwhile, the OpenStack Foundation is set to upgrade its products and services with Newton's features.

Google open sources 3D mapping library

Google has announced that it is open sourcing its library for mapping movement in 2D and 3D. Called Cartographer, the library offers real-time simultaneous localisation and mapping (SLAM) with open source robot operating system (ROS) support.

Cartographer opens endless possibilities to deploy software systems for robots, drones and self-driving cars. It is already powering the backbone technology of the popular Roomba vacuum project. Also, the open source project uses various hardware sensors combined with a camera to map your home as the robot cleans the floor.

"Cartographer builds globally consistent maps in real-time across a broad range of sensor configurations common in academia and industry," the Google engineering team wrote in a blog post.

While the current version of Cartographer is heavily focused on LIDAR SLAM, Google is hoping for community support to enable it across various sensors and platforms.

Red Hat open sources Ansible Galaxy to offer advanced automation

Red Hat has released the open source Ansible Galaxy project to enable automation with community integration. This new announcement offers a hub for developers to share Ansible Roles developments publicly.

The open source availability of Ansible Galaxy highlights Red Hat's interest in the ever-growing open source community. At the same time, the latest project expands Ansible Roles, which presently acts as the 'common language' of Ansible functionality and offers content directories to enable reuse, refactoring and sharing of processes between various teams, organisations and environments.

"The Ansible community is thriving, and Red Hat hopes that by open sourcing the Ansible Galaxy code repository, we will be able to advance open source automation technology, and specifically Ansible Galaxy, in new and interesting ways," said Tim Cramer, head of engineering for Ansible, Red Hat, in a statement.

Are You In Suspense?

Are you wondering what happened to your order or payment, even after a fortnight? But did you mention your name and address clearly while sending payment, and what the payment was for?

We get several payments every month without adequate instructions or even identity of the person sending the payment. As a result we are unable to take appropriate action on these, till we get a complaint - if at all.

At EFY, we want you to be our satisfied customer. So please do let us know in case your payment or instructions are not even acknowledged within a fortnight. We are not that lazy!
