Figure 1: UltraDefrag's features

- For Windows versions later than Windows 2000 only, the *\$Bitmap* and other internal NTFS files can be defragmented.
- For Windows NT 4.0 and Windows 2000, NTFS disks with a cluster size greater than 4 kilobytes cannot be defragmented.
- UltraDefrag is not able to process NTFS disks as effectively as it does on Windows XP and later versions of Windows for Windows NT 4.0 and Windows 2000 NTFS, due to the complexity of disk rules.

Installation

We can obtain the latest version of UltraDefrag from [SourceForge](#). Two types of packages are available for the UltraDefrag download.

- Full-featured installer:** This will install all the program features but cannot be used directly from USB drives as it requires standalone installation.
- Portable package:** This package can be downloaded, unpacked and used without any installation. We can use this package anywhere by carrying it in a USB stick.

The prerequisites for installing UltraDefrag on Windows are an Intel Itanium processor and an appropriate 64-bit edition of Windows. To install and run UltraDefrag on your system, you must be an administrator of the system.

Silent installation

UltraDefrag installation can be done silently by adding the `/S` switch to the command line. No dialogues will appear, and the entire program will be installed automatically with all the features enabled on the hard disk in silent mode.

The command line switches supported in UltraDefrag are shown in Figure 2.

To install the full edition of UltraDefrag in Portuguese with only the *Start* menu in silent mode, execute the command given below:

/LANG	• Language to be installed i.e. <code>/LANG="Portuguese"</code> to install the Portuguese language pack.
/FULL=1	• Install all the components and icons.
/MICRO=1	• It will install only core components and boot time interfaces only.
/ICONS={0 1}	• Installs or removes all shortcut icons. 0 to remove all icons and 1 to install all icons

Figure 2: Silent installation switches

```
ultraDefrag-6.0.0.bin.1386.exe /S /STARTMENUICON=1 /LANG="Portuguese" /FULL=1 /ICONS=0
```

To uninstall the UltraDefrag in silent mode, execute the following code in the command line interface:

```
%CD_INSTALL_DIR%\uninstall.exe /S
```

Graphical and console interfaces

Console interface: To automate defragmentation via batch scripts and scheduling tasks, UltraDefrag provides a console interface. This is nothing but the command line environment, which is used to handle the context menu entries in Windows Explorer. To rejoin any object's clusters, we can right click on the object and defragment it with UltraDefrag. Figure 3 shows the console interface of UltraDefrag.

Graphical interface: UltraDefrag GUI is very simple to use. Select the disk and then either analyse, optimise or defragment it. If you select multiple disks, these will be processed one after the other.

Figure 4 shows the graphical interface (GUI) of UltraDefrag.

Scheduled defragmentation

The Windows Task Scheduler can help us automate the defragmentation of frequently used files.
