

database. It also provides the user with comprehensive support for virus scanning via Internet Explorer and even Outlook. It doesn't include any real-time scanner and uses manual systems to scan files.

Features:

- Scanning scheduler with user logged in only
- Automatic updation for virus definitions
- Standalone virus scanner
- Outlook attachments scanner
- Portable version can be used via USB pen drive

Angry IP Scanner

Systems administrators always need to quickly scan the network to find a particular workstation or device. In such situations, Angry IP Scanner comes to the rescue.

This is a widely used open source and multi-platform network scanner for fast IP address and port scanning. It can scan IP addresses in any range as well as their ports. It requires no installation and can be just copied and used. Angry IP Scanner simply pings each IP address to check if it's alive; then, optionally, it resolves its hostname, determines the MAC address, scans ports, etc. The amount of data gathered about each host can be extended with plugins.

It also has additional features like NetBIOS information (computer names, workgroup names and currently logged in Windows users), favourite IP address ranges, Web server detection, customisable openers, etc.

Scanning results can be saved to CSV, TXT, XML or IP-Port list files.

Features:

- Small, efficient and fast port scanner
- Reverse IP lookup and MAC address lookup
- Complete IP range support from 1.0.0.1 to 255.255.255.255
- Automatic OS detection and contains additional network configuration tools

UltraDefrag

UltraDefrag is an open source disk defragmentation tool for Windows operating systems, available under the GNU General Public License. It enables sys admins to eliminate the problem of file fragmentation and, in turn, speeds up machines as these need to do less mechanical work to read continuous data from disks. UltraDefrag fixes almost everything, including files that are locked; it is launched inside the Windows boot process, when most of the files are not in use.

UltraDefrag analyses all the information with respect to the files and free space on the disk; then, depending on what the user selects, the program defrags the disk and performs optimisation, which eliminates fragments of wasted space, packing the files closer together.

Features:

- Simple and efficient defragmentation algorithms
- Smart defragmentation of locked paging, hibernation files, and NTFS metafiles and streams
- One-click defragmentation via Windows Explorer
- Multi-lingual GUI, powerful CUI, and automatic hibernation or shutdown after job completion
- Fully supports 64-bit edition Windows OS, and is free to be distributed and used
