

```
CharSequence charSequence, int start, int end, int lnum) {
    if(mPath == null) {
        mPath = new Path();
        mPath.setLastPoint(left, top);
        mPath.lineTo(right, top);
        mPath.lineTo(right, bottom);
        mPath.lineTo(left, bottom);
        mPath.lineTo(left, top);
    }

    Paint.Style oldStyle = paint.getStyle();
    float oldStroke = paint.getStrokeWidth();
    paint.setStrokeWidth(3);
    paint.setStyle(Paint.Style.STROKE);
    canvas.drawPath(mPath, paint);
    paint.setStrokeWidth(oldStroke);
    paint.setStyle(oldStyle);
}
}
```

You may take the above class as a reference on achieving more control over how text or any of its properties are drawn on screen. We have covered many of the most common text Spans here but there are many other useful Spans that can help

you implement your custom effects such as SubscriptSpan, UnderlineSpan and TypefaceSpan. You are advised to explore the `android.text.style` package for more information on these Spans. We would like to point out that many of the classes and interfaces in the package do not provide good documentation and some do not provide any documentation at all; so you may need to learn some effects by trial and error.
