

Build a Multi-player Game Application in App Inventor 2

If you are eager to build a mobile app, there is no better application than App Inventor 2 to start you up. We have been carrying this series for quite a few months now. We have built the simplest apps, and are slowly building more and more complex ones. This article features an app for noughts and crosses (xoxo) to be played by multiple players.

I hope readers are playing around with their ideas and creativity while developing Android apps. I would like to see the application download links if you have uploaded any of your apps on to the Google Play Store. Since we started this journey, we have explored the various 'intelligent' components and features of our smartphones.

Now, when we talk about App Inventor specifically, we can proudly say that we have mastered the components available in the palette. Playing around with the designer and block editor is so much fun.

Multi-player games are the trend now because of the fun involved in playing with your friends or competing with strangers across the world. The technology that

makes this possible is the real-time integration and communication between all connected devices. We have explored Firebase in two of my previous tutorials, and I hope you are now completely familiar with its capabilities that enable even beginners to build smartphone apps.

In this Android app development journey we have covered all those basic-to-complex applications that are essential for our daily use. Now, let's develop a simple, yet fun-filled Android game application. Hope you all have played the very popular XOXO (noughts and crosses) game in your childhood.

The theme of the application

The theme is pretty simple and you may have already played the game hundreds

of times on paper. But the cool part here is, you don't need a pen or paper. We will be playing it with the help of our smartphone.

GUI requirement

For every application, there is a graphical user interface or GUI that helps the user to interact with the on-screen components. How each component responds to user actions is defined in the block editor section.

The GUI requirements for Screen1 are listed below.

1. **Label:** Labels are the static text components that are used to display some headings or text on the screen.
2. **Button:** Button will let you trigger the event and is a very essential component.
3. **Horizontal arrangement:** These
