

Component	Name	Description
Label	NowDrawingLbl	Text: Last by:
Horizontal arrangement	Default	Length: Fill parent Container for button components
Button	WipeButton	Text: Wipe
Button	RedButton	Text: Red
		Background colour: Red
		Text colour: White
Button	BlueButton	Text: Blue
		Background colour: Blue
		Text colour: White
Button	BlackButton	Text: Black
		Background colour: Black
		Text colour: White
Canvas	Default	Height: 300 pixels
		Width: Fill Parent
		Line width: 5

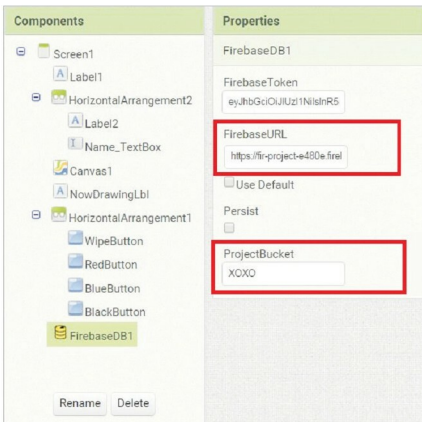

Figure 4: Firebase properties

1. At the top we have the title of our application. It's always a good practice to name your application and show it on the screen as well. We have put a label for it and have set its text property to the name of the application.
2. Below that we have a name label and textbox for the users to type in their names. We will store the same name in the Firebase database.
3. Next, we have a canvas which will be our main playing area. We will draw over that area.
4. When two players are involved, it is better to keep track of who has made the last move to avoid confusion. So we have added a label below the canvas, which will show the name of the player who has finished drawing on the canvas, most recently.
5. The horizontal arrangement holds all the action buttons. As we have explained earlier, keeping these buttons within an arrangement will make the horizontal arrangement their parent, and all the components within will be the children.
6. We have named all the buttons with their respective colours. So it is clear by their names what each of them will correspond to.
7. Last, we have the Firebase component, which is what will make our application multi-player. I hope you have read the previous two articles of this series which dealt with Firebase's functionality. If you are already familiar with it, then you probably may have created a project in Firebase and have set the Firebase URL into the properties.

Now, to work on the block editor to define the behaviour, let's discuss the actual functionality we expect from our application.

1. First, the user will draw a game board of the XOXO game, which is four crossed lines.
2. Each player will take her/his turn and draw (an X or O) on the game board.
