Packaging and testing

To test the app, you need to get it on your phone. First, you have to download the application to your computer and then move it to your phone via Bluetooth or a USB cable. I'll tell you how to download it.

1. On the top row, click on the 'Build' button. It will show you the option to download the

apk to your computer.

2. In the course of downloading, you can view how it progresses and once successful, the application will be placed in the *Download* folder of your directory or the location you have selected for your downloading.
3. Now you need to get this *apk* file to your mobile phone either via Bluetooth or via a USB cable. Once you have placed the *apk* file in your SD card, you need to install it. Follow the on-screen instructions to install it. You might get some notification or warning saying *Install from un-trusted source*. Allow this from the settings and after successful installation, you will see the icon of your application in the menu of your smartphone. Here, you will see the default icon, which can be changed; we will tell you how to do this as we move ahead. I hope your application is working exactly as per the

requirements you have set. Now, depending upon your usability and customisation, you can change various things like the image, sound and behaviour as well.

Debugging the application

We have just created the prototype of the application with very basic functionality. What else could the user be interested in? Let's look at the various use cases in which your app should be able to perform well. Consider the following use cases:

- Wouldn't it be nice to add some data validation upon entering the data in lower or upper case?
- Can you extend the app to draw circles on the canvas, as soon as it is touched?

These are some scenarios that might occur and users will be pretty happy seeing them implemented.

Think about all these scenarios and how to integrate them into the application. Do ask me if you fail to address any of the above cases.

You have successfully built another useful Android app for yourself. Happy inventing!
