

Linux kernel 3.12.64 LTS brings improved networking stack

Linux 3.12 has received the sixty-fourth maintenance update to its long-term supported (LTS) kernel. This new

LTS update comes just a day after Linux Torvalds officially announced Linux kernel 4.8.

As stated by Linux developer Jiri Slaby, Linux kernel 3.12.64 has a big patch of 135 files, 924 insertions and 481 deletions. It comes with security fixes and major updates to the networking stack. Also, there are several hardware architecture improvements.

The latest Linux 3.12 version has hardware architecture improvements for systems powered by Alpha, ARC, ARM64, AVR32, ARM, CRIS, Blackfin, FR-V, Hexagon, RA64, MetaG, MicroBlaze, MIPS, MN10300, OpenRISC, PA-RISC, PowerPC, s390, SPARC, SH and x86. Additionally, there are fixes to various issues for EXT4, UBIFS and NFS file systems.

Slaby's team has also made numerous changes to IPv6 and IPv4 protocols, Netfilter, the mac80211 wireless framework and IrDA components. Likewise, the update includes better support for USB, SCSI, ISDN, EDAC, ACPI and GPIO devices.

It is worth noting here that the Linux 3.12 series has received a fresh update almost a year after the last release, and the Linux Foundation will support the kernel till the end of 2017. SUSE Linux Enterprise (SLE) 12 Service Pack 1 is one of the popular distributions based on Linux kernel 3.12.

Users running the Linux distro powered by the kernel from the 3.12 series are recommended to upgrade to 3.12.64 LTS. The sources are available on the official kernel website.

offer BREAD (browse, read, edit, add and delete) capabilities. There is also a client-side plugin with JQuery and Ajax to give developers automated features.

"YetaWF excels as a platform for

rapid custom development by building the most powerful tools into one seamless package," said Mike van der Meulen, lead developer at Softel vdm, in a statement. "Our new open source Web framework narrowly focuses on offering 100 per cent of the features that will satisfy most average websites," he added.

Site administrators can utilise the easy upgrade utility offered by Softel vdm to keep their websites up to date in an automated manner. Additionally, YetaWF works remotely even via a phone or tablet to provide tools like user/role authorisation and general site management.

Walmart.com's application platform is now open sourced

WalmartLabs has released the open source version of the same application platform that was originally powering the Walmart.com website. This new development has enhanced the tech division's presence in the open source community. The division had already designed several projects for the developer community.

Dubbed as Electrode, the application platform has been backing Walmart.com over the last year. It not only accomplished the migration to React and Node.js but also made the e-commerce site capable of handling 80 million monthly visitors and delivering 15 million items for sale.

"With over a few hundred engineers and dozens of applications, the Electrode platform was built to solve core problems that every large-scale organisation faces," wrote Alexander Grigoryan, director of software engineering at Walmart Global, in a *Medium* post.

Walmart's Electrode platform comes in three different parts to let developers easily build their universal apps on React and Node.js. These three parts include Electrode Core, Electrode Modules and Electrode Tools.

While the core component of the application platform enables the development

of a consistent structure, its modules counterpart gives access to pre-packaged modules to integrate into any existing apps and make them efficient enough to handle complex tasks and features. The third and the most important section of the platform is the tools that give

reusable components such as Explorer, Electrify and Bundle Analyser to help optimise JavaScript bundles.

The Electrode platform is already powering various fields on the Walmart.com site. Sections like Home, Login, Cart and Checkout are so far managed by the open
