

This command will show all the commits made to the Git repository.

After making the commit, if we make any changes to the repository, and we want to revert back to the last commit, then we can do so by using the following command:

```
git reset --hard
```

If some changes have taken place on the Git server from where the current working Git repo was cloned, and we need the changes in our local Git repo, use the following command:

```
git pull origin master
```

This will pull in all the changes that have taken place in the Git hosting server. Similarly, any changes that need to be pushed to the remote server can be made using the following command:

```
git push origin master
```

This will push all the commits to the Git server.

Tortoise Git

Tortoise Git is a Windows graphical interface to Git and is based on the Tortoise SVN. It is open source software based on the GPL. Interactions with Tortoise Git are done using the Windows context menu.

Tortoise Git can be downloaded from <https://tortoisegit.org>.

After installing Tortoise Git, you can see the following three new options on your Windows Right click Context menu.

```
Git Clone...
Git Create repository here...
TortoiseGit
```

These are the menu items that will be useful to work with Git on Windows, graphically. The following are the tasks that we have carried out earlier, using Git on the command line and now, we will perform these using Tortoise Git.

To create a new Git repository, follow the steps shown below:

1. Go to an empty directory where you want to create a Git repository.
2. Right click and select *Git Create repository*. This will create a *.git* folder, which will make this directory an empty Git repository. For our example, we will add two files, *a.c* and *b.c*, to this repository. The following steps will add these files.
 1. First add these files to the current directory.
 2. Right click on this folder and you will see the option '*Git Commit -> master*'.
 3. Click on this option and you will see the menu shown in Figure 1.
 4. Type the message in the message box. This is the message

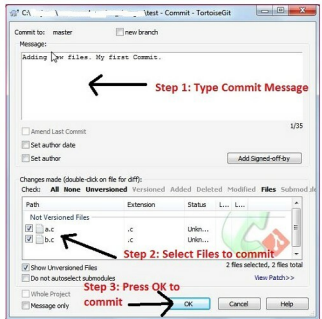

Figure 1: Git commit menu

about what you are about to do. In the example, I have given the message 'Adding new files. My first Commit'.

5. Then select the files you want to add to the repository from the file list, as specified in step 2 of Figure 1.

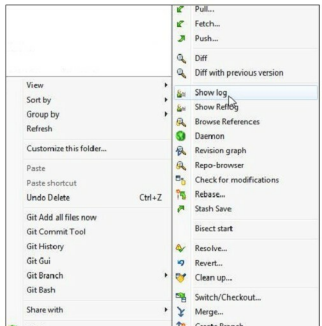

Figure 2: Git log menu

6. Next, press OK to push these changes to the Git repository.

Take the following steps to see whether the changes are added to the Git repository and to see the current status of the Git repository.

1. Right click and go to *TortoiseGit -> Show log* as
