

be used to monitor the temperature and sound if InfluxDB is up, and then either query or write data into the database. The REST API can be used by applications to insert data into the database. InfluxDB also ships with client libraries in multiple languages, which makes it easier for you to integrate it into your applications.

We can use the */query* endpoint via the Curl utility to see the existing data that it returns for the temperature measurements that we currently have in our database:

```
curl -G 'http://localhost:8086/query?pretty=true' --data-urlencode "db=OfficeMonitoringDB" --data-urlencode "q=SELECT * FROM temperature WHERE officename='01'"
```

```
{
  "results": [
    {
      "series": [
        {
          "name": "temperature",
          "columns": [
            "time",
            "officename",
            "value"
          ],
          "values": [
            [
              "2016-10-02T06:38:13.0756743Z",
              "01",
              23.1
            ],
            [
              "2016-10-02T06:38:18.9803483Z",
              "01",
              23.2
            ],
            [
              "2016-10-02T06:38:20.7346376Z",
              "01",
              23.1
            ],
            [
              "2016-10-02T06:38:22.3410358Z",
              "01",
              23.3
            ],
            [
              "2016-10-02T06:38:24.2453072Z",
              "01",
              23.2
            ]
          ]
        }
      ]
    }
  ]
}
```

Figure 2: InfluxDB admin Web application with SELECT statement

Similarly, the command to insert a new temperature measurement via the REST API is shown below:

```
curl -i -XPOST 'http://localhost:8086/write?db=OfficeMonitoringDB' --data-binary 'temperature,officename=01 value=23.8'
```

Time series databases have gained prominence in recent times due to the popularity of sensor-based IoT applications, monitoring applications and multiple other use cases that are a good fit for them. InfluxDB is a leading time series database that has seen significant traction and is known for its simplicity and ease of use, along with its ability to perform at scale. It supports a wide range of client libraries and has binaries that run across multiple operating systems and architecture, including ARM. If you are looking for a time series database for your project, give InfluxDB a try.
