createAccounts('accounts.csv', toplevel_mapping, login_hdr)

```

There are some potential issues in transferring accounts from GNUCash to GNUKata. For example, in GNUKata, you either have an account or a sub-group. However, in GNUCash, a sub-group can function as a normal account as well. An account in GNUCash is consistent with a sub-group of GNUKata if the placeholder flag is true.

However, the objective of this article is to become familiar with the communication between a client application and the core server, and no attempt is made to handle corner cases.

GNUCash transaction data may also be exported as CSV files. The above utility may be similarly extended to handle that data as well.

The Web-based frontend, gkwebapp, makes it easy to view and enter the data. The communication with the server happens as in the utility above, and it is done from the code residing in the views directory of the gkwebapp.

You may, as an exercise, extend the Web application to import GNUCash accounts into GNUKata and learn that as well!
