

there is respect both ways has been a balancing act that's never easy. It's something I work quite hard on, and hope we can keep getting it better.

Q What is your advice to those who are planning to begin with CentOS?

The most important thing to remember for those planning to begin with CentOS is that you are not alone. There is lots of documentation as well as tremendous support and help from a vast community. So as a new user, make sure you engage with the existing user base, ask questions, and spend a bit of time to understand what and how things are. In the long term, understanding the details will pay off.

CentOS Linux is built on a lot of past experience. Anyone starting down the path of adoption should keep this in mind. We've tried to build a culture of helping those that need the most help, but also encourage new users to learn and grow with the community.

Q What are the biggest features that we can see in the next CentOS release?

The Special Interest Groups (SIGs) are constantly releasing new content all the time. As an example, the Cloud SIG released OpenStack Ocata within a few hours of the upstream project release. There is also a lot of work being done in the Atomic SIG around containers, and in the Virt SIG on existing and upcoming virtualisation technologies.

Q Lastly, where do you see CentOS in the future of open source?

CentOS Linux, due to its characteristics, is a great fit for areas like Web hosting, Web services, cloud workloads and container delivery. Also, as a platform for long-term community centric workloads, it is a good option in areas like HPC and IoT. The Linux distribution also specifically suits the needs of the education sector—starting and supporting not only IT education

but education as a whole. Moreover, I would like to see CentOS Linux extend its footprint as a vehicle for enablement.

And this is where the CentOS Project provides a great space for other open source projects—building services for CI/CD, interacting with the users, finding the niches that people care about and solving real-world problems.

If you are involved today with an open source project, I strongly encourage you to get in touch with me and discuss its development areas.

We measure our success on the basis of how successful CentOS has been for the people, the communities, the open source projects and the users who have invested their time, resources and support for the CentOS Project. And we look forward to solving more problems, building better solutions and bridging more gaps together.
