

Using the Spring Boot Admin UI for Spring Boot Applications

Using Spring Boot makes it easy for developers to create standalone, production-grade Spring based applications that can be 'just run'. Spring Boot is a part of microservices development.

As part of developing microservices, many of us use the features of Spring Boot along with Spring Cloud. In the microservices world, we may have many Spring Boot applications running on the same or different hosts. If we add SpringActuator (<http://docs.spring.io/spring-boot/docs/current/reference/htmlsingle/#production-ready>) to the Spring Boot applications, we get a lot of out-of-the-box end points to monitor and interact with applications. The list is given in Table 1.

The end points given in Table 1 provide a lot of insights about the Spring Boot application. But if you have many applications running, then monitoring each application by hitting the end points and inspecting the JSON response is a tedious process. To avoid this hassle, the Code Centric team came up with the Spring Boot Admin (<https://github.com/codecentric/spring-boot-admin>) module, which provides

us an Admin UI dashboard to administer Spring Boot applications. This module crunches the data from Actuator end points, and provides insights about all the registered applications in a single dashboard.

We will demonstrate the Spring Boot admin features in the following sections.

As a first step, create a Spring Boot application that will be a Spring Boot Admin Server module by adding the Maven dependencies given below:

```
<dependency>
  <groupId>de.codecentric</groupId>
  <artifactId>spring-boot-admin-server</artifactId>
  <version>1.5.1</version>
</dependency>
<dependency>
  <groupId>de.codecentric</groupId>
  <artifactId>spring-boot-admin-server-ui</artifactId>
  <version>1.5.1</version>
</dependency>
```
