

Open Source Enables PushEngage to Serve 20 Million Push Notifications Each Day!

Bengaluru-based PushEngage has deployed open source technologies such as Apache, Bootstrap, MongoDB, MySQL, Node.js and Nginx to handle its push notification service. More than half of its clients are based outside the country.

The digital marketing world has been ruled by the electronic direct mailer (eDM) for quite some time. But the eDM is now making way for push notifications. Be it an e-commerce site or an online news publication, Web masters are deploying push notifications to grow their traffic as well as enhance their brand. But what does a push notification provider deploy to serve a bulk of notifications? Well, it is usually an open source solution!

Bengaluru-based PushEngage is among the few early adopters of push notifications. The company had built an in-house product to test the success rate of notifications circulated over-the-air at the time when Google offered the same support to Chrome in April 2015. The initial results were strong enough to commercialise the product.

"We saw robust results even at the

early stage, which is when we started considering building PushEngage and went on to create an automated marketing platform for browser-based push notifications, available to all," recalls Ravi Trivedi, founder and CEO, PushEngage.

With a small team of just 10 employees, Trivedi's PushEngage handles marketing automation through notifications for more than 6,000 clients around the world. The total client base sends over 20 million notifications on a daily basis. All of that comes from 40 servers that run in the cloud, and use a mix of proprietary and open source solutions at the back-end.

A 10-member team handles more than 6,000 global clients to serve over 20 million push notifications on a daily basis!

The prime reason behind the mountainous growth of PushEngage is the ease of its deployment on any website. Local search site AskLaila, which receives over a million monthly unique visits, claims that notifications through PushEngage can be deployed in as early as ten minutes. The service has also helped the company retain its users. "With PushEngage notifications, we have been able to reach out to users who are not active on the site and provide them with helpful offers or information," says Nitin Agrawal, director of engineering, AskLaila.com.

Bringing community offerings to the mainstream

Trivedi tells *Open Source For You* that while his company had initially chosen components that helped to scale better, along with a faster development time,
