Redshift, Amazon S3 and Amazon DynamoDB.

- Provides developers with client libraries that enable the design and operation of real-time data processing applications. When you add the Amazon Kinesis Client Library to the Java application, it will notify when new data is available for processing.
- It is cost-efficient for workloads of any scale. You can pay as you go for the resources used and pay hourly for the throughput required.

## AWS Chatbot

AWS Chatbot is an interactive agent that makes it easy to monitor and interact with Amazon Web Services. It enables DevOps and software

development teams to use Amazon Chime and Slack chat rooms to monitor and respond to operational events in their AWS cloud.

AWS Chatbot supports notifications to services like Amazon GuardDuty, Amazon CloudWatch, AWS Health, AWS Budgets, AWS CloudFormation and AWS Security Hub.

Its features are:

- Can be added to Slack Channel or Amazon Chime chatrooms in a few clicks.
- Provides chatroom specific permission controls through AWS Identify and Access Management (IAM).
- Receives notifications about operational incidents and other events from supported sources, such as operational alarms, security alerts, or budget deviations.
- Supports CLI commands for most AWS services, making it easy to monitor and manage your AWS resources from Slack on desktops and mobile devices. **END** 🐧
