shippingservice-8685dd9855-pmgjm 1/1 Running 0 8h
```

Table 1 lists a few commands that you can use to get information from `kubectl`.

Lens can help you get all the information listed in Table 1 and more for a specific cluster. We can also perform edit and delete actions on Kubernetes resources using Lens.

Let's see how this works. Select *Pods* in the *Workloads* section (Figure 6). We can edit, delete, access logs, access terminals of pod from Lens itself. Cool, right?

You can verify all *deployments* in the *Workloads* section (Figure 7), verify all *Replicasets* in the *Workloads* section (Figure 8), all *Secrets* in the *Config* section (Figure 9) and all

Services in the *Network* section (Figure 10).

You can see how easy it is to navigate to all resources, and effectively find all Kubernetes resources from a single place quickly. We can edit YAML files in Lens and apply it at runtime to see the change.

We can also configure multiple clusters deployed by multiple cloud service providers and use Lens for visibility and troubleshooting. **END** 🐧
