

growing. Blockchain eliminates the need for a facilitator in the processing of payments, which is another important reason for its growth.

According to data from Statista.com, the market size of blockchain

technology has been growing quite quickly over the past several years, and is expected to reach close to US\$ 40 billion by 2025.

The acceptance of cryptocurrencies in some countries is encouraging

companies and investors to increase their investments in blockchain technology. Decentralised finance (DeFi) is a new blockchain-based financial system that lessens the power banks have over financial services and payments. Market growth of blockchain technology is anticipated to be driven by strategic efforts in the decentralised finance domain.

Blockchain vs traditional applications

Blockchain improves the traceability, security, trustworthiness, and transparency of data shared across a corporate network while saving costs. The traditional web based applications are centralised, which can be exploited or hacked by malicious traffic.

Blockchain for businesses employs an open, unchangeable digital ledger that only authorised blockchain members can view. The nodes of the network control what data each organisation or member may view, and what actions they may take. Because business partners don't have to trust one another, blockchain is frequently referred to as a 'trustless' network.

This trust is based on the increased security, transparency, and immediate traceability of blockchain technology. Beyond issues of trust, blockchain offers commercial advantages such as cost savings due to accelerated speed, efficiency, and automation of transactions.

Blockchain technology has the potential to fundamentally alter how sensitive and important data is seen. It reduces fraud and illegal behaviour by generating a record that cannot be changed and is encrypted end-to-end. By employing permissions to restrict access and anonymizing personal data, privacy concerns are addressed. In order to prevent hackers from accessing data, information is kept across a network of computers rather than on a single server.
