

<i>Risk categories</i>	• High • Medium • Low • Informational • False positive
<i>How is it useful in DevOps practices implementation?</i>	Penetration testing
<i>Can we integrate it with Pipeline as Code?</i>	Yes
<i>Is a commercial flavour available?</i>	N/A
<i>ZAP Docker image scan</i>	Docker stable image can be obtained using docker pull <code>owasp/zap2docker-stable</code>: 1. ZAP - baseline scan: It executes the ZAP spider against the specified target for 1 minute and then completes the passive scanning. zap-baseline.py -t <target> [options] 2. ZAP - full scan: It executes ZAP spider against the specified target, an optional Ajax spider scan and then a full active scan. zap-full-scan.py -t <target> [options] 3. ZAP - API scan: This is suitable to perform scans against APIs defined by OpenAPI, SOAP, or GraphQL zap-api-scan.py -t <target> -f <format> [options]

10. Grafana

Grafana is available as a fully managed tool with Grafana Cloud, or you can run the enterprise version on your infrastructure with self-managed options. You can visit publicly available dashboards from <https://grafana.com/grafana/dashboards/> and import them in your Grafana instance to visualise data quickly.

In my experience, Grafana is one of the most useful tools while using Kubernetes on-premise or cloud providers such as AWS, Microsoft Azure or GCP. It supports Windows, Linux, and MacOS. It is easy to install, configure, and manage Grafana and monitoring metrics keeping Prometheus as a data source.

<i>Initial release</i>	2014
<i>Stable release</i>	9.3.1
<i>Written in</i>	Go, TypeScript
<i>Licence</i>	GNU Affero General Public License, version 3.0

<i>Website</i>	https://grafana.com/
<i>GitHub repository</i>	https://github.com/grafana/grafana
<i>Supported data sources</i>	• Alertmanager • AWS CloudWatch • Azure Monitor • ElasticSearch • Google cloud monitoring • Graphite • InfluxDB • Jaeger • Loki • Microsoft SQL Server (MSSQL) • MySQL • OpenTSDB • PostgreSQL • Prometheus • Tempo • Testdata • Zipkin
<i>Features</i>	• Panels - heatmaps to histograms • Plugins - https://grafana.com/grafana/plugins/ • Alerts • Annotations
<i>How is it useful in DevOps practices implementation?</i>	Visualisation of monitoring metrics. Another important thing to note is that you can convert the logs of third party tools into normal logging such as <i>Google Cloud Logging</i> -> <i>Create Log Router Sink</i> to route logs to supported Google services.
<i>Is a commercial flavour available?</i>	https://grafana.com/pricing/

Loki is built on an open source, horizontally scalable, highly available, multi-tenant log aggregation system started at Grafana Labs in 2018 and released under the AGPLv3 license. It is designed to store and query logs from applications and infrastructure. Loki follows minimal indexing. It creates an index only for metadata and not for the entire log text. **END** 🐙
