

speed up the process of writing, maintaining, and observing high-throughput, concurrent applications.

Every six months, Oracle distributes new Java feature updates via a predetermined release schedule. This cycle offers a consistent flow of innovations while enhancing the platform's performance, stability, and security.

FerretDB 1.0 to be the 'truly open source' alternative for MongoDB

The 1.0 production release of FerretDB, which its developers refer to as a "truly open source MongoDB alternative," offers "all the essential features capable of running document database workloads." FerretDB is an open source proxy that converts MongoDB 6.0+ wire protocol requests to SQL using PostgreSQL as the database engine. It is made available under the Apache 2.0 licence. The goal is to return MongoDB database operations to their "open source roots," according to FerretDB Inc.

FerretDB supports the use of MongoDB workloads with PostgreSQL and other database back-ends. While work is still being done to support SAP HANA and SQLite, Tigris is also supported as a back-end. FerretDB installation instructions may be obtained on GitHub.

Aiven introduces free PostgreSQL, MySQL, and Redis plans

Open source cloud data platform Aiven has announced free plans for the open source database services Aiven for PostgreSQL, Aiven for MySQL, and Aiven for Redis. Anyone can get these free plans with technical assistance from a recently opened community forum.

Everyone can now utilise the Aiven platform without any obligations or additional fees thanks to the company's new free options. The advanced Aiven platform capabilities are all included in the free plans. These consist of daily backups, integration with Terraform, and dedicated instances, among others. Aiven free plans can be smoothly, safely, and automatically upgraded to more extensive paying plans as needed, once they have been started.

The new Aiven Community Forum, which debuts alongside the new plans, provides technical help for Aiven's free plans. Developers can communicate and work together on the programs and services they are creating using open source data technologies in the Aiven Community Forum. The Aiven team and other community members are available for developers to ask questions of, receive support from, and share what they are developing.

"By making our portfolio of open source tools that our customers love accessible to all, we're enabling the next generation of developers to begin learning and expanding their skillset without having to endure the traditionally high costs," said Oskari Saarenmaa, co-founder and CEO of Aiven. "Providing access to these free plans is another step in realising Aiven's vision of democratising open source technologies, making them available to everyone and reinforcing our commitment to the open source community."
