

Industrial Metaverse: Industry 4.0's Date With Metaverse

Siemens Process Simulate (left) connects to NVIDIA Omniverse (right) to enable a full-design-fidelity, photorealistic, real-time digital twin (Courtesy: Siemens)

A well-orchestrated interplay of digital twins, the Internet of Things, and artificial intelligence—with scalable apps, communication networks, and immersive virtual reality—the emerging industrial metaverse spells savings and sustainability for industries, across manufacturing, construction, grid, infrastructure, transport, and more.

Honestly, the moment someone says metaverse, we think of a hi-fi gaming environment, which people enter as avatars to play games or for social networking. We also know that companies, ranging from carmakers to banks, have started using this as a platform to engage with customers and showcase their products and services. It is a great place

for brand promotion with celebrities and companies selling collectible non-fungible tokens (NFTs), virtual merchandise, and other fancy stuff. Unless you take a deeper look, it looks like just another marketing channel.

Silently, behind all this hullabaloo, industries have started using the metaverse and associated technologies for real tangible gains. This emerging

application of the metaverse—generally referred to as the industrial metaverse—is likely to grow even faster than commercial and consumer spaces as the benefits are near-term and measurable. “The metaverse is quickly getting sub-segmented into various streams, influenced by the business domains. A metaverse for gaming has different applications and needs as compared
