

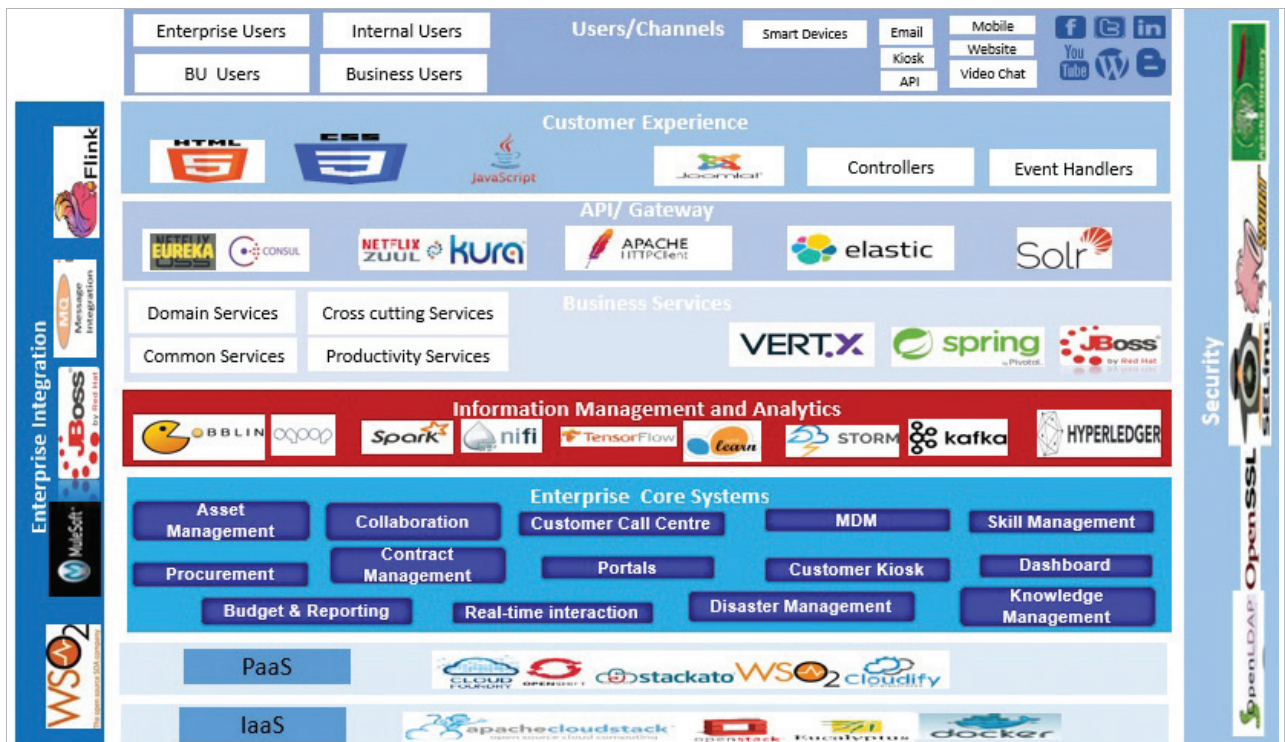

Figure 2: Open source adoption for the enterprise

public clouds, built and disseminated by a large and democratic community of developers, in collaboration with users. It is mostly deployed as Infrastructure-as-a-Service (IaaS), whereby virtual servers and other resources are made available to customers. The software platform consists of interrelated components that control diverse, multi-vendor hardware pools of processing, storage, and networking resources throughout a data centre.

Cloud Foundry: Cloud Foundry is an open Platform-as-a-Service (PaaS) which provides a choice of clouds, developer frameworks and application services. Cloud Foundry makes it faster and easier to build, test, deploy and scale applications.

It has different distributions, and the popular ones are Pivotal and IBM. It contains application runtime and container runtime. It also has Pivotal application service and Pivotal container service.

OpenShift: This is Red Hat's cloud computing PaaS offering. It is

an application platform in the cloud, where application developers and teams can build, test, deploy and run their applications.

Cloudify: Cloudify was developed and designed on the principles of openness to power the IT transformation revolution. It enables organisations to design, build and deliver various business applications and network services. The latest version of Cloudify is 4.3, which incorporates enhanced features like advanced security, control and true self-service. It has introduced a totally new concept for container orchestration with Kubernetes (Kubernetes cloud native orchestration)

WSO2: This Platform-as-a-Service (PaaS) framework from the Apache free source community provides elastic scalability features for any type of service, using the underlying infra cloud. WSO2 has a microservices based architecture that fosters agility and flexibility.

Apache Cloud Stack: This open source software platform is

designed to position and manage the cloud computing environment. It is an Infrastructure as a Service (IaaS) cloud computing platform. Various service providers use Cloud Stack to offer public, private, and hybrid cloud services.

Eucalyptus: This is an open source software platform for implementing Infrastructure as a Service (IaaS) in a private or hybrid cloud computing environment. It allows users to deliver their own data centres into a private cloud, thus extending the services to other organisations. Eucalyptus is designed to provide services compatible with Amazon's EC2 cloud and Simple Storage Service (S3).

To sum up, open source cloud helps to drive digital transformation and realise its benefits like better business agility, an improved customer experience and enhanced quality of service. It helps enterprises to move from transaction-based services to relationship-based services. It also paves the way for new digital services
