

Kubeflow 1.7 will improve support for transformer-based models

Transformers are revolutionising machine learning (ML) capabilities and ushering in a new age of generative AI. However, how do data scientists create models that completely utilise the power of transformers? The open source Kubeflow initiative aims to help with that.

Since the release of Kubeflow 1.6 in September 2022, the widely used open source MLOps platform hasn't received an update until now, when Kubeflow 1.7 became broadly available. At its core, Kubeflow is an open source machine learning toolkit that enables businesses to install and manage ML workflows on Kubernetes infrastructure built for the cloud. The Kubeflow 1.7 update includes, among its themes, an emphasis on improving support for transformer based models.

Model makers must learn how

to efficiently use resources as they transition to transformer based models. Workload placement and auto scaling can be aided by Kubeflow 1.7, which can help to optimise processes and use fewer resources.

The addition of 'Parallelfor' statements, which allows developers to more effectively use parallel processes across AI accelerator hardware, benefits the Kubeflow Pipelines component in particular in the 1.7 update. Another advantage of Kubeflow 1.7 is its ability to be integrated with an increasing number of cloud native technologies that can facilitate the deployment of MLOps workflows.

Support for rotating stamps enhances the Stamp tool in Tux Paint 0.9.29. You can rotate objects using this function before stamping them onto the canvas. Additionally, a shaped gradient fill is now possible with the new Fill tool. This update to the rainbow colour picker makes it simpler to apply subtle adjustments to any colour, significantly enhances the functionality of the Shapes tool, and adds new options for defining how template images should be scaled, positioned, and smeared.

Tux Paint 0.9.29 also includes a quick-start guide that quickly explains the features of the program in addition to a new keyboard shortcut for quicker access to the Eraser tool while drawing with other tools.

Hensoldt offers an end-to-end OSINT system

Gathering intelligence from various sources is a challenging, time-consuming, and expensive job due to the large number of open source codes that expand, change, or phase out every year. This is the reason why machine learning, artificial intelligence, and Big Data analytics have revolutionised the market for open source intelligence (OSINT) products in recent years. These new technologies have changed how open
