

- Python API to create custom topologies
- Inbuilt diagnostic tools such as ping and iperf
- Setting performance parameters like bandwidth, delay, and many more in the network setup

With SDN we can create multiple virtual networks on a common infrastructure, but what if we could virtualize the various network functions? These network functions would be abstracted from their physical location just like server virtualization beneath a hypervisor, where the network could grow without any addition to the devices. We have seen many services like firewalls, content delivery networks, routers, and load balancers run on proprietary hardware, but now they have been released in the form of a virtualized solution. This is being done by the using of network function virtualization, and it has been reshaping the telecommunications industry. **END**

```
statement::Declaration((p, q), symbol) => {
  if let Expression::Symbol(_a, _b), TokenType::Symbol(address) = symbol {
    if self
      .symbol_table
      .get(&(self.scope_level, *address))
      .is_some()
    {
      return Err((
        (*p, *q),
        RuntimeError::SymbolAlreadyDefined(
          self.get_symbol_name(*address).unwrap(),
        ),
      ));
    } else {
      self.symbol_table
        .insert((self.scope_level, *address), DataTypes::Unknown);
    }
  }
}
```

Figure 4: Executor code for a declaration statement in Malluscript

```
num = number_thada;
factorial = 1;
repeat_adi 0 um num um same_alle {
  factorial = factorial * num;
  num = num -1;
}
dhe_pidicho "Factorial is : " + factorial + "\n";
```

The same in pure Malayalam Unicode is shown in Figure 5. Malluscript's code is open source and available on

```
പൊളിനാധനം നമ്പർ;
പൊളിനാധനം ഫാക്ടോറിയൽ;
ദേ പിടിചോ "ഭയവായി നമ്പർ തരുക: ";
നമ്പർ = നമ്പർ താടാ;
ഫാക്ടോറിയൽ = 1;

നിപീറ്റടി ൦ ഉം നമ്പർ ഉം സെയിറ്റ അല്ല {
  ഫാക്ടോറിയൽ = ഫാക്ടോറിയൽ * നമ്പർ;
  നമ്പർ = നമ്പർ -1;
}

ദേ പിടിചോ "ഫാക്ടോറിയൽ : " + ഫാക്ടോറിയൽ + "\n";
```
