

Scout APM releases TelemetryHub

Application performance monitoring (APM) service provider Scout APM has announced the launch of TelemetryHub via its Early Access Program (EAP). By utilising the open source initiative OpenTelemetry, TelemetryHub offers observability solutions for small- to medium-sized engineering teams.

Scout, which was first developed as a server monitoring tool in 2009, has since expanded to offer insight into the performance of applications for a growing number of supported languages. It is currently developing into an observability platform that will allow teams to diagnose problems and shorten the mean time to resolution (MTTR) by providing a straightforward, reasonably priced, and practical single pane of glass view across distributed systems.

Users can ingest telemetry data from platforms instrumented with the OpenTelemetry CNCF initiative using TelemetryHub. As an early adopter of OpenTelemetry, TelemetryHub has the support of a project that has amassed over 100,000 contributors from the community. TelemetryHub is dedicated to evangelising and supporting the project through contribution and education. This gives users the chance to employ an ever-evolving, vendor-neutral solution that gives them complete control and freedom with their observability data.

TelemetryHub will enable users with a stake in the stability and health of their systems to take advantage of the comprehensive diagnostic tools offered by the new platform to increase understanding and decrease MTTR thanks to usage-based pricing and no-seat licences.

Being the first Wi-Fi 7 access points in the market to embrace open standards, all Wi-Fi 7 variants will come pre-installed with open source software. The introduction of Wi-Fi 7 will primarily support the country's upcoming 5G rollout, particularly for enhancing inside coverage. Additionally, the technology will make it easier to construct a variety of apps because of its increased throughput, dependable network performance, and lower latency.

Elon Musk may turn Twitter into an open source platform that encourages free speech

Elon Musk's Signal text exchanges, which were made public in advance of the trial, reveal his goal to turn Twitter into an open source, democratically beneficial platform for free speech. Elon Musk had conversations with a few people in an

effort to determine the value of the company before making the US\$ 44 billion offer to purchase Twitter.

His Signal text communications with a number of well-known figures in business and technology have just been made public. Mathias

Döpfner, the CEO of Axel Springer, the parent company of *Business Insider*, texted Elon Musk at one point, pleading with him to buy Twitter and promising to "manage" the firm on his behalf.

Since Musk works to promote freedom of speech in the broadest sense, it is obvious that these remarks are exactly what got him. People who raise crucial problems are frequently silenced on platforms like Twitter. Many Twitter users who backed Musk noticed that their tweets were being deleted. These tweets earned a small number of likes and responses despite interaction statistics that were high (often in the thousands). Additionally, it was observed that some tweets, particularly those that were critical of Twitter, were displayed to a group of Twitter users entirely unrelated to the concerns or problems they were discussing and who were not followers of the account that sent them.

Musk and former Twitter CEO Jack Dorsey had another text conversation that showed Musk was sincerely dedicated to making Twitter a high-quality and open platform. Dorsey reportedly proposed that Twitter employ an open source protocol, similar to that used by the Signal messaging platform. Musk promised Dorsey that, if possible, he would work towards it.

Red Hat rolls out OpenStack Platform 17

OpenStack, an open source Infrastructure-as-a-Service (IaaS) cloud, is still seen by some as being obsolete. They are utterly mistaken. OpenStack is the most widely used open source cloud, according to *Statista*. The fact that OpenStack is the lifeblood of the telecom industry, including Verizon cellular and 5G networks, is even more significant for Red Hat. So it should come as no surprise that Red Hat highlighted the relationship between OpenStack and telecom while announcing Red Hat OpenStack Platform (RHOP) 17 at the Mobile World Congress in Las Vegas this year.

Red Hat also emphasised how closely it is collaborating with its Kubernetes based OpenShift release with this release. Some people believe that OpenStack and Kubernetes are competitors. They aren't. Red Hat is demonstrating how they may cooperate to benefit from both virtual machines and containers.
