

“We have found over the last couple of years that the conversation is not a religious dispute between the two platforms but rather where their workloads are served best,” said Maria Bracho, lead product manager for OpenStack. Therefore, a virtualized control plane that uses OpenShift is now supported by OpenStack

version 17. This makes it possible for customers to run virtual machines (VMs) and Kubernetes based cloud native services on the same cloud.

Dynamic resource allocation is another feature of the revised OpenStack 17 that supports “lighter” deployments. These are

deployments that don’t need as many services, such as edge computing.

The new RHOP will primarily appeal to the telecom industry, but it is still a reliable platform for other use cases. These consist of edge deployments, private clouds, and public clouds. Anyone who prefers to manage their own cloud over entrusting their services to a hypercloud provider like Amazon Web Services, Azure, or Google Cloud should give RHOP some thought.

Google launches OpenXLA, an open source ML compiler project

Google Cloud has introduced the OpenXLA open source machine learning compiler ecosystem at its Next '22 conference. A community-led and open source ecosystem of ML compiler and infrastructure projects, OpenXLA has been created by Google in collaboration with AMD, Arm, Meta, NVIDIA, AWS, Intel, Apple, and other AI/ML developers. By allowing developers to select the frameworks and hardware they want for their ML projects, OpenXLA attempts to address the problem of framework and hardware incompatibilities, which can hinder the development of machine learning algorithms.

The OpenXLA project’s goal is to enable effective lowering, optimisation, and deployment of machine learning models from the majority of major frameworks, including PyTorch and TensorFlow, to any hardware backend (particularly CPUs, GPUs, and ML ASICs), through collaboration with major ML frameworks and hardware vendors.

Its objectives are: promote XLA industry collaboration and create a thriving OSS community; exchange ideas and solicit input on OpenXLA’s technical

direction to make sure it satisfies the requirements of its key users and contributors; create a new XLA repository or organisation that is independent of hardware and framework, has infrastructure

to more easily accept PRs, and has independent build and test; and ensure that the removal of XLA from TensorFlow causes the fewest possible disruptions for current users and contributors.

The XLA compiler, which was created to simplify modelling in TensorFlow by accelerating the training process and lowering overall memory usage, will be the first goal of the new community project, said Sachin Gupta, Google VP and GM of

The Clearing House joins OIN as a community member

The Clearing House (TCH) has joined as a community member of the Open Invention Network (OIN), which was founded to protect open source software (OSS) and is currently the largest patent non-aggression group in history. TCH is reaffirming its commitment to OSS as an enabler of cutting-edge financial services payment platforms. It runs US-based payments networks that clear and settle more than US\$ 2 trillion in payments daily through wire, ACH, check image, and real-time payments.

Through royalty-free cross-licensing of Linux System patents, the OIN community upholds patent non-aggression in core Linux and related open source technology. Similar royalty-free licences are granted for Open Invention Network patents to any company that pledges not to oppose the Linux operating system with its own patent claims. On <http://www.j-oin.net>, the OIN licence can be signed electronically

“Advancements in financial services and FinTech increasingly rely on open source technologies,” said Keith Bergelt, CEO of Open Invention Network. “As the most experienced payment company in the US, and a keystone for the financial services industry, we are pleased that The Clearing House is committed to patent non-aggression in core Linux and adjacent open source technologies.”

“We remain focused on integrating the best technologies in our payment networks, which help to deliver services that our banks’ customers value and trust. We enable all financial institutions to offer safer, faster, and smarter digital transaction services, and open source is a significant innovation driver in these offerings,” said Sean Reilly, senior vice president and associate general counsel at The Clearing House. “We are pleased to join the Open Invention Network and support its role in protecting open source software.”
