

Connecting Internet of Things Devices on Thinger.io

This article is about connecting various IoT devices on Thingy.io, an IoT platform. This step-by-step tutorial will guide you on how to connect a development board to the platform and start sending data from the device.

Developments in devices connected by the Internet of Things (IoT) achieve higher functionality because they interface via a distributed network with numerous physical objects. They are equipped with embedded software, sensors and connectivity choices with the objective of collecting and sharing data with each other as well as with the central point through the internet. This opens the doors to various challenges in terms of data processing, storage and security. IoT platforms bridge this gap between the world of physical objects and of actionable insights.

Every IoT ecosystem has its own unique set of input, processing and output elements. However, all of them have the typical flow setup shown in Figure 1, which consists of the components listed in Table 1.

1	Physical objects: People, things, machines, vehicles
2	Raw data: Reading of any parameter
3	Sensors: Conversion of any physical quantity to an electrical signal
4	Quick decision at the edge: Urgent decision making through limited resources
5	Storage: Physical/cloud based choices
6	Data analysis: Study and processing of data

Table 1: Components of IoT

An IoT platform is an on-premises software suite or a cloud service (IoT platform as a service [PaaS]) that monitors and may manage and control various types of endpoints. Open source

IoT platforms are gaining popularity by blending hardware devices, APIs and online services for task management.

Thingier.io provides a scalable cloud base to connect devices. With the help of its admin console, it can be linked to a project through various boards like Raspberry Pi, Arduino, ESP8266, and Intel Edison. Open source libraries imported by the user assure scalability, security and speed through a couple of lines of code.

There are various components and applications offered on the Thingier.io menu bar. Our task for now is limited to adding a device — the first and preliminary step to start an ecosystem.

The first step involves signing up to the platform. Enter your personal details for the profile settings. Remember this also becomes your user name for all further processing on this
