

Figure 6: Installing the board for ESP8266 chip

Figure 7: Device ESP8266 is now connected on the Thingier.io IoT platform

```

thing.handle();
}
arduino_secrets.h
#define USERNAME "your_user_name"
#define DEVICE_ID "your_device_id"
#define DEVICE_CREDENTIAL "your_device_credential"
#define SSID "your_wifi_ssid"
#define SSID_PASSWORD "your_wifi_ssid_password"

```

Alternatively, install the *Thingier.io* custom library. Follow the path *File>Examples>thingier*.

io>ESP8266>serial debug.

Compile and upload the code as we do for any other Arduino code. Once implemented, the inbuilt LED in the ESP8266 should glow.

If the steps are implemented correctly, Thingier.io should show that ESP8266 has been connected (Figure 7).

We just saw how to connect ESP8266 to Thingier.io. Do follow the steps to connect it or similar development boards to try out more possibilities with the platform. END 🐧
