

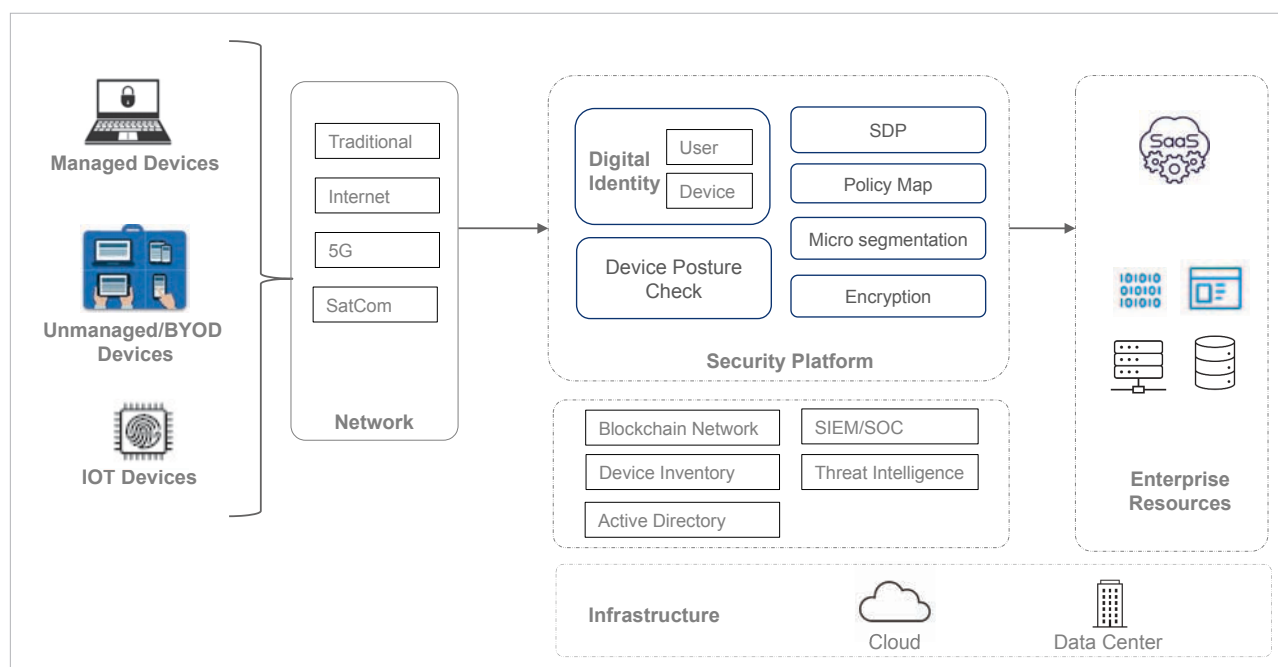

Figure 4: Deploying blockchain for SDP

the user needing to install anything on the device.

- **Visibility and forensics:** In order to maintain compliance with and enforce the requisite policies and systems, organisations should implement procedures for the continuous visibility and assessment of their environment. These procedures have a constant cycle of implementing a ZTNA (zero trust network access) posture, monitoring it, and adjusting it. In this model, user records are linked to blockchain and kept in cryptography format; they can only be updated with the appropriate authentication. Every change made to the document is notified to the owner and everyone in the chain. The last phase is the evidence collection technique, where a digital ledger from the blockchain is used to record all user and device activity. This digital ledger is tamper-free and can be viewed by everyone in the loop. This can be perfect evidence for investigation if data gets leaked in the organisation.

Open source platforms

There are many blockchain open source platforms available that can be leveraged for implementing a blockchain defined perimeter. Some of them are listed below.

- **Hyperledger:** Hyperledger Foundation hosts a number of enterprise-grade blockchain software projects.
- **Ethereum:** This is an open source blockchain platform that helps in running smart contracts and provides different programming tools to create them.
- **BigchainDB:** This open source distributed ledger system is designed for storing large data

sets and enabling its developers to deploy various blockchain proofs-of-concepts and applications.

- **HydraChain:** This is an open source extension of the Ethereum blockchain platform that helps in developing and deploying different permissioned distributed ledgers.
- **Corda:** This is one of the preferred open source blockchain platforms for building and developing various permissioned distributed ledger systems.
- **Tron:** This is one of the largest blockchain based operating systems. **END** 🐧
