

According to a recent *Trend Insight Report* from research company Gartner:

- As of 2022, barely 10% of businesses would have undergone any significant transition thanks to blockchain technology.
- At least one ground-breaking blockchain based company will be valued at US\$ 10 billion by 2022.
- Blockchain's value to businesses is estimated to increase to over US\$ 3.1 trillion by 2030, from just over US\$ 360 billion in 2026.

One of the most exciting potential blockchain technology applications is cybersecurity. Data manipulation is a persistent issue for companies of all sizes. With blockchain technology, you can be certain that your data is safe and that all parties involved can independently confirm the legitimacy of any given file.

How competitive are job openings in the blockchain industry?

The employment market for blockchain experts is only getting started. However, as more and more sectors investigate blockchain's possibilities, the need for skilled blockchain workers is skyrocketing.

You may be wondering what these occupations entail and whether or not companies are currently hiring. Some examples of such roles are listed below.

Blockchain creators: Companies seek blockchain engineers with the knowledge to assist in exploring blockchain platforms. People are so anxious to reap blockchain's many advantages that blockchain development may now be the most sought-after profession. Blockchain developers are computer programmers who build blockchain based software. Before becoming blockchain developers, most programmers have spent several years mastering languages like C++, Python, and JavaScript.

Blockchain solution architects:

The blockchain solution architect coordinates the efforts of the many specialists (including developers, network administrators, UX designers, and IT operations) that make up a team to plan, create, and implement the various parts of a blockchain solution.

Manager of blockchain projects: This person coordinates the efforts of those working on blockchain projects and the specialists whose job is creating blockchain solutions. Project managers working on the blockchain will require the same abilities as their more conventional (cloud) counterparts. They must also be technically proficient to completely understand the technology. Good communication skills are also crucial; these will be needed when sharing vital updates with employees who aren't technical and when lobbying for funding from higher-ups.

Blockchain UX designer:

As more and more sectors use blockchain, the need for a dedicated blockchain UX designer grows. Building a trustworthy and engaging user interface is a key part of a blockchain designer's job. In addition to being detail-oriented, creative, and diligent, the ability to spend long periods at a computer is essential for this field.

Engineer of blockchain quality: We always have a quality assurance engineer on hand in a development setting to do tests and ensure everything is up to snuff. A blockchain engineer performs a similar function in the

blockchain space by ensuring that all activities in the blockchain development environment are of the highest quality. They carry out the tasks of testing and automating blockchain frameworks. Because even a little error impacts everyone utilising their technology, these people need to have a third eye when paying attention to detail. Maintaining positive connections at work also requires exceptional communication skills.

Consultant in blockchain law:

Unavoidably, legal questions emerge when businesses attempt to get their heads around integrating blockchain technology. As businesses begin to use this cutting-edge innovation, they are also seeking the advice of legal professionals about the factors they should take into account. They ponder the potential outcomes of various courses of action, seek advice on managing their finances, and struggle to rein in their own identities. For someone in this position, fluency in English is crucial. Since blockchain is a decentralised network, you need to also be well-versed in international legislation. For the same reason, it's recommended that students learn as many global languages as possible.

Blockchain is now gaining recognition, in no small part due to Bitcoin and other cryptocurrencies, with numerous real-world uses for the technology already deployed and researched. Blockchain, a term on the lips of every investor in the country, has the potential to improve company and government processes while cutting costs and streamlining the supply chain. **END** 🐧
