

Hooked on React Hooks!

In this two part in-depth tutorial on React Hooks, we will learn how to use the React Native library. We will also learn how to use hooks to create React Native components.

ReachJS is a JavaScript library for building user interfaces. This is the official one-liner introduction to ReactJS, and the user interface is a multi-option playground. Here, the user can create the needed UI, and libraries like ReactJS help create the playground.

React is declarative in the sense that we write the code we want. It is in charge of taking our declared code and performing all of the JavaScript and DOM steps to get us to our desired result. React Native uses primitives to render to native platform UI. It creates platform-specific versions of components, so a single code base can share code across multiple platforms. With React Native, one team can maintain two platforms — Android and iOS — and share common technology, i.e., React.

Introduction to React Native

React Native is a popular JavaScript based mobile app framework that allows you to bind natively rendered mobile apps for iOS and Android. You will get the look and feel of an Android and iOS app even though you use a JavaScript based code. React components wrap existing native code and interact with native APIs via React's declarative UI paradigm and JavaScript. This enables native app development for a whole new team of developers and lets existing native things work much faster.

One of my favourite features of React is 'fast refresh'. This is a React Native feature that allows you to get near-instant feedback for changes in your components. Fast refresh is enabled by default, and you can toggle 'enable fast refresh' in the React Native developer menu. With fast refresh enabled most edits should be visible within a second or two, and it preserves the React local state in function components. This is done by default in hooks, which we will learn about shortly. This leads to faster development and fewer development times. If you have experience with native development, you are already familiar with how long the build times usually are. So this is a huge help.
