

Figure 9: Nginx welcome screen

Once minikube is up and running, let's visit the minikube dashboard (Figure 3).

```
PS C:\WINDOWS\system32> minikube dashboard
* Enabling dashboard ...
  - Using image kubernetesui/dashboard:v2.6.0
  - Using image kubernetesui/metrics-scraper:v1.0.8
* Verifying dashboard health ...
* Launching proxy ...
* Verifying proxy health ...
* Opening http://127.0.0.1:55011/api/v1/namespaces/
kubernetes-dashboard/services/http:kubernetes-dashboard:/
proxy/ in your default browser...
```

You can check and verify the allocation of resources in the minikube dashboard shown in Figure 4.

Deployment of load balancer in minikube

Let's use Nginx deployment in a minikube cluster.

```
PS C:\WINDOWS\system32> kubectl create deployment
--image=nginx nginx-app
deployment.apps/nginx-app created
```

Once successfully deployed, you can verify the deployment in the minikube dashboard, as shown in Figure 5.

The dashboard also shows services in the minikube (Figure 6).

Figure 7 shows the Nginx pod and container.

Now, expose the Nginx deployment as follows:

```
PS C:\WINDOWS\system32> kubectl expose deployment nginx-app
--type=LoadBalancer --port=80
service/nginx-app exposed
```

Next, execute the minikube tunnel.

```
PS C:\WINDOWS\system32> minikube tunnel
Status:
  machine: minikube
  pid: 5388
  route: 10.96.0.0/12 -> 192.168.59.101
  minikube: Running
  services: [nginx-app]
errors:
  minikube: no errors
  router: no errors
  loadbalancer emulator: no errors
```

Verify the external endpoint in the service section of the minikube dashboard (Figure 8).

Now click on the external endpoint URL (Figure 9).

The following commands are available for different actions in minikube.

- Check minikube status: `minikube status`
- Stop minikube: `minikube stop`
- Delete minikube cluster: `minikube delete`
- Uninstall minikube: `choco uninstall minikube`
