

A workshop was held as part of the launch to go over the tools available to develop Indian language technology for students, researchers, and startups. Nilekani said: “The Digital India Bhashini mission has been launched with the goal of all services and information being available to citizens in their own language with “collaborative AI” at the core of the design. AI4Bharat will accelerate the Indic language AI work as a public good and is fully aligned with the goals of the Bhashini mission.”

Dr Khapra, associate professor at the IIT's Department of Computer Science and Engineering, said that while English and a few other languages had seen major advancements in language technology, Indian languages had fallen behind. The goal of the Nilekani Centre is to close this gap.

IBM Research launches DS4SD, an open source toolbox for scientific research

In an effort to accelerate the pace of scientific discovery, IBM Research has for the first time made a portion of the IBM Deep Search experience available through an open source framework.

Documents form the foundation of every organisation, including financial accounts, technical specifications, legal briefs, and research papers. These contain a wealth of useful information, but because they are typically in an unstructured

QuickMPC, an SMPC engine, is now open source

Acompany, a startup that was established in Japan in 2018 by student business owners, has announced that QuickMPC, a secure multiparty computing (SMPC) engine (which is a privacy-enhancing computation or PEC) has been made available as open source software. This is claimed as the world's first client-server SMPC open source software. When employed in machine learning and basic static calculations, QuickMPC can operate on personal data while maintaining privacy. This will make it possible for companies and engineers anywhere to construct SaaS products that employ SMPC functionalities without the requirement for in-depth SMPC knowledge using Python and JavaScript (TypeScript) client libraries.

A major concern today is data protection. Previously unregulated data utilisation has grown more challenging as a result of legislation protecting personal data, such as GDPR and CCPA. Additionally, according to Gartner's forecast, 60 per cent of major enterprises will employ at least one PEC approach in analytics, business intelligence, and/or cloud computing by 2025.

Acompany became involved in blockchain technology before finding SMPC. Since there was no practical level open source SMPC, the company decided to create QuickMPC on its own. Two client libraries and the QuickMPC engine have now been made available by the company.

Takeharu Kondo, CTO of the firm, commented on the release: “In 2019, researchers were the primary users of the majority of secure computing engines’ open source software. So we separately created QuickMPC with success. We have now made it available as open source software.”
