

only for the session when you are logged in, not afterwards.

ExpireAtSessionEnd: Set this option to 'true' to make Firefox clear the cookies when you close the browser.

Behavior: Set this to 'reject-foreign' to block third-party cookies.

BehaviorPrivateBrowsing: Set this to 'reject-foreign' to block third-party cookies in private-browsing tabs and windows.

DisableAppUpdate: Set this to 'true'. Unlike in old versions, Firefox updates on its own and breaks a lot of add-ons and features with every new release. By changing the setting to 'false', you can decide when to update Firefox. But will you not be attacked by hackers who exploit bugs and zero-day vulnerabilities if you do so? No. That's the misconception about browser updates. Your browser is sitting on a stack of unfixed bugs and zero-day vulnerabilities that is as long as the distance between the Earth and the Moon. Browser makers fix only those bugs that they think are urgent and whatever catches their whim or fancy.

What you should do is create two Firefox installations and two Firefox profiles. You should update the first installation regularly and the second one rarely. Place your add-ons in the second and use it only for casual browsing such as reading news or consuming RSS feeds. Use the first one for financial transactions or sites that require you to log in. No, you do not have to log in to your Google account to perform your search or watch a video. Ignore pop-ups telling you how jolly it is to log in and end up being tracked.

Create a casual-browsing profile for the old browser. Give the profile a name such as 'ole'.

```
/opt/firefox-old/firefox --ProfileManager
```

Create a launcher with this command so that you can run the rarely updated Firefox installation with the casual-browsing profile ('ole').

```
/opt/firefox-old/firefox -P ole
```

Create a secure-browsing profile for the new browser. Give the profile a name such as 'nuovo'.

```
/opt/firefox-new/firefox --ProfileManager
```

Create a launcher with this command so that you can run the regularly updated Firefox installation with the secure-browsing profile ('nuovo').

```
/opt/firefox-new/firefox -P nuovo
```

Do not install any add-ons in this profile. Every add-on that you install is another set of eyes on your data.

The `/opt` directory belongs to root. If you extract the Firefox *download* file to your home directory and then copy it to `/opt`, then the Firefox directory will have your user permissions. This means Firefox will be able to update itself when you run it. Set root permissions on these Firefox installation directories.

```
sudo chmod -R root /opt/firefox*
```

These Firefoxs will run from the read-only `/opt` directory but will be able to create their profile directories in your home directory — the writeable `~/.mozilla` directory.

Remember that you must first create the *policies.json* in its proper location and then create the profiles and installations.

DisableBuiltinPDFViewer: When you click on a PDF document link, the document opens like a web page and disappears when you close the browser! Set this option to 'true' if you want the document saved to the hard disk and then open in Evince or whichever PDF reader you have installed.

DisableFirefoxStudies: Set this option to 'true'. No amount of 'studying' seems to be helping Mozilla. I would not have written this article if it did. Unless you are a beta tester, Firefox does not have to study anything.

Search: Set this option to 'false'. The search URL has some tracking information. You also do not want to notify Google every time you start your browsing.

TopSites: Set this option to 'false'. If the browser is listing your top sites, then that means Firefox is monitoring your browser activity.

Highlights: Repeat the action for this option.

Pocket: Set this option to 'false'. It requires you to create an account with Mozilla so they can track you better.

Snippets: Set this option same as previous option.

Locked: Set this option to 'true' to prevent you from mistakenly changing any of the settings.

DisableFirefoxAccounts: Set this option to 'true'. Do not create any Firefox accounts. Mozilla says it does not have money to develop the Thunderbird email client, but it does have money for creating accounts for millions of users!! It seems to have misplaced priorities.

DisablePocket: Set this option to 'true' for the same reason as for previous option.

DisableFirefoxStudies: Not a beta tester? Set this option to 'true'.

DisableTelemetry: Set this option to 'true' for the same reason as for previous option.

DisplayMenuBar: Firefox developers stole this 'innovation' from Chrome. 'Options' means decisions. 'Decisions' means thinking. Chrome users do not think so. Google thinks for them. If you are the type that thinks, set
