

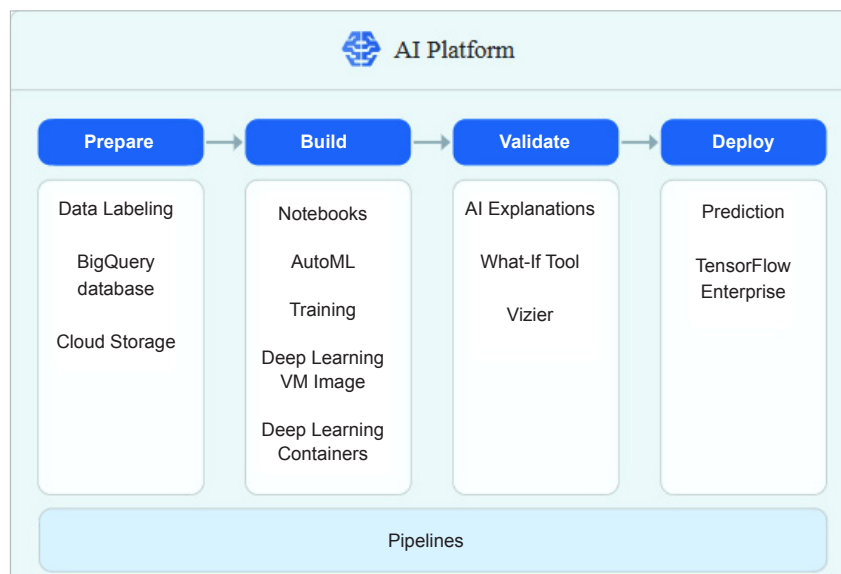

Figure 1: The stages of Google's AI platform

(CMS) have been trying to address this space for a long time.

Cloud platforms like Azure offer the Form Recognizer while AWS has the Amazon Rekognition for document handling. These enable document extraction, data processing from the document, and transforming the data

into structured data. Google already provides a lot of AI enabled APIs like OCR processing, translate API and form extraction API. It has now introduced DocumentAI, also called DocAI, which is a unified API platform for document handling activities and is now generally available.

As per Google, the implementation of DocAI in Unifiedpost, a Fintech company in Belgium, has helped the latter improve TCO by up to 60 per cent, while the data capturing accuracy has gone up by about 250 per cent.

The DocAI platform has multiple services called processors, like OCR processor, document splitter processor, form parser, invoice parser, and receipt parser, to name a few.

Figure 2 gives the GUI interface of Google DocAI.

To use this API service, you can go to Google Marketplace from your Google subscription and search for DocumentAI in API Explorer. From this, you can select a processor that you want to use like invoice parser or receipt parser, and upload your document to test the document extraction, data formation and interpretation from the extracted data.

DocAI ensures security is handled properly when a document is uploaded and processed in the platform. Also, by training the data being extracted in DocAI like invoice processing, it can
