

neural network or reinforcement learning model, is designing the architecture of the neural network that aims to solve the machine learning task.

AutoML Vision enables you to:

- Train models from labelled images and evaluate their performance
- Leverage a human labelling service for data sets with unlabelled images
- Register trained models for serving through the AutoML API

AIOps for Google Cloud

AIOps for Google Cloud is a suite of tools that combine technologies like AI, ML and cloud computing to simplify the tasks of IT professionals. AIOps tools primarily enhance and perform four tasks for IT operation:

1. Allow IT professionals to automatically observe the analytics, events, and logs of cloud based IT systems.
2. Enable IT support teams to engage, interact, and resolve issues in an automated fashion.

3. Help automate patch installation, request fulfilment, cloud service provisioning, and other IT operations.
4. Allow the automation of governance models, and add end-to-end visibility for better management of IT organisations. AIOps has the following benefits:
 - Improves productivity and

reliability of cloud automation

- Reduces mean time to recovery (MTTR) of cloud services
- Enhances the functionality and manages insights into cloud automation
- Offers faster detection of issues within cloud automation
- Provides continuous optimisation and intelligent decision-making **END**

Figure 5: Successful deployment of Flask application to AWS server

Deploying a Flask web application to AWS cloud server

After launching the AWS EC2 Server using Elastic Beanstalk, the Flask web app can be uploaded and deployed at the AWS cloud server. A sample screenshot of the successful deployment of our application at the AWS EC2 cloud server using the Elastic Beanstalk platform is shown in Figure 5.

Flask is one of the most popular web application development frameworks with a rich set of features that make it ideal for large

companies. Fields that use the Flask framework for their web application development include social media, e-commerce sites, etc. In this article, we have demonstrated how to deploy a Flask web application at both physical and AWS cloud servers. It can be seen that deploying web applications at AWS enables user flexibility in terms of elastic load balancer and auto scaling. **END**
