

Hesa launches an app for the women entrepreneurs in the Ubuntu consortium

Karnataka chief minister Basavaraj Bommai launching the tech application created by Hesa

Ecommerce platform Hesa has announced the launch of a tech application for Ubuntu – a consortium that aims to create a marketplace for women entrepreneurs who run micro and medium-sized businesses. The app, created by Hesa, will help these women entrepreneurs to showcase and sell their products. It will also provide technology and market linkage capability to support the existing women entrepreneurs in the Ubuntu consortium.

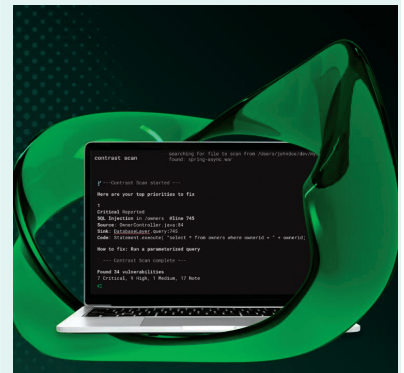

Hesa is a unified social, digital and physical (phygital) commerce platform enabling digital transactions of products and services in rural India. With an integrated B2B marketplace, the platform is enabling buying and selling of various services and products with an almost ‘doorstep access’. It has built a network of 30,000 village network entrepreneurs serving more than 3,000,000 rural consumers in a short span of time. Hesa has partnered with more than 65+ brands. It is a trusted B2B digital platform backed by the strength and power of a large ground force called ‘Hesaathis’.

Ubuntu was registered as an NGO on International Women’s Day 2019 with eight founding members. Today, it is a consortium with 24 women’s associations indirectly reaching out to 12,000 women entrepreneurs from across Andhra Pradesh, Goa, Telangana, Madhya Pradesh, Mumbai, Delhi, and Tamil Nadu.

Vamsi Udayagiri, founder & CEO of Hesa, said, “This is a proud moment for us. Hesa’s endeavour has always been to uplift entrepreneurs, and with this launch we are more committed to empower women entrepreneurs of micro to medium-sized enterprises, who want to have a wider reach for their products and services”

CodeSec gets SCA capabilities

Software composition analysis (SCA) capabilities, according to a recent announcement from Contrast Security (Contrast), are now available in CodeSec, the ‘developer-first’ scanner, without charge. So it offers free application security testing and SCA in a single, developer-friendly interface. With the help of this new SCA functionality, developers will be able to rapidly and correctly detect risky third-party libraries and start writing secure code. They can start shipping code with confidence while simply developing a standardised software bill of materials (SBOM) to control supply chain risks, thanks to a frictionless install, quick scanning of open source software, and immediate actionable findings.

CodeSec, which was developed using the technology employed by Contrast’s customer base of hundreds of thousands of developers at some of the biggest brand-name companies in the world, improves developer security by providing a range of capabilities directly to the developer’s laptop without charge. These include discovery of dependencies, protection of code, and protection of cloud-native applications.
