

OS-Climate releases three tools for analysing climate data

Three analytical tools for supporting climate action have been made available for public collaboration by the non-profit OS-Climate, which is run by the Linux Foundation. OS-Climate provides open source data and software tools to promote the transition to climate-aligned finance and investing. Its members worked together to develop the three tools, which are 'Physical Risk & Resilience', 'Portfolio Alignment', and 'Transition Analysis', under the leadership of BNP Paribas, Allianz, and Airbus, respectively.

The OS-Climate Data Commons, which will serve as a public utility of corporate and other climate data, will be used by the tools. The Data Commons, which was introduced at COP26 last year, aims to meet the financial sector's urgent demand for transparent, consistent, and interoperable climate-relevant data.

The Physical Risk & Resilience Tool enables financial and non-financial stakeholders to identify and quantify risk associated with climate resilience using asset vulnerability models that try to estimate the frequency and severity of extreme climatic events.

The Climate Portfolio Alignment Tool assists financial stakeholders in aligning portfolios with the Paris Agreement aim of reducing global temperature rise to 1.5°C at the level of individual holdings and loans.

Finally, businesses will be able to model, test, and undertake scenario analysis for climate-aligned strategic decisions thanks to the Transition Analysis Tool.

Amazon, BNY Mellon, EY, Federated Hermes, Goldman Sachs, the London Stock Exchange Group, Microsoft, the UN-convened Net-Zero Asset Owner Alliance, Ortec Finance, Red Hat, and S&P Global are among the companies that make up OS-Climate's 'real economy' corporate members.

Foundry gives a Bitcoin grant to Stratum V2 protocol developer

Foundry Digital LLC (or Foundry), a service provider for organisations in the digital asset mining and staking industry, has made public a grant of 1 Bitcoin (BTC) to 4ss0, a pseudonymous developer working on Stratum V2, an open source protocol that outlines how Bitcoin miners, proxies, and mining pools communicate in order to contribute Hashrate to the Bitcoin network.

The proof-of-work coordination layer that links the miner and the pool is greatly improved by Stratum V2 and offers higher levels of efficiency, security, and decentralisation. The communication between the miner and the pool is considerably improved by Stratum V2 over the original Stratum protocol by switching the default communications to binary rather than JSON and adding encryption.

Although these are significant advancements in themselves, the developer will use the funding to concentrate on Stratum V2's Job Negotiation Protocol implementation. Job Negotiation, a Stratum sub-protocol that enables miners to create their own block templates, will increase Bitcoin's resistance to censorship by decentralising the process.

The developer and the Stratum V2 team will be connected to the Foundry USA Pool team in addition to receiving a BTC grant from Foundry, which will also provide access to Bitcoin ASICs and Hashrate for testing.

The Stratum protocol is the industry norm for communication between miners and pools of various proof-of-work digital assets, including Ethereum, Zcash, and Monero, despite being mostly associated with Bitcoin mining. The development of open source Stratum V2 reference implementations may influence other protocols and boost industry efficiency, security, and decentralisation.

The money will be given out once the developer completes the work on the project.

Zilliz announces key contributions to Milvus 2.1

Zilliz, whose founders developed the Milvus open source project, has revealed significant contributions to the Milvus 2.1 release. The new functionality addresses the most frequent worries of developers by bridging the gap across data pools, destroying data silos, and improving performance and availability.
