

The LF AI & Data Foundation's graduated-stage open source project Milvus, which is utilised by numerous businesses in various industries, is designed for scalable similarity search. As data volumes and workloads rise, it can readily scale and embrace distributed design. Milvus allows DML operations (adding, deleting, and updating) and near real-time search of vectors on a trillion-byte scale.

Milvus 2.1 will offer the additional functionality necessary for contemporary security mechanisms, such as ACL (access control lists) and sophisticated encryption techniques, in addition to integration and security elements.

Flashpoint acquires Echosec to expand its open source intelligence capabilities

Open source intelligence startup Echosec Systems Ltd has been purchased by business risk intelligence startup Flashpoint for an unknown sum. Set up in 2013, Echosec gives security and intelligence teams increased real-time access to a variety of open source intelligence data (OSINT). Platforms and application programming interfaces provided by the company transmit pertinent data from websites including social media, the deep web, and the black web. The information can be utilised for

crisis management, brand protection, counterterrorism, disinformation monitoring, and geopolitical risk assessments.

The OSINT that Echosec offers to intelligence professionals can be utilised to support physical and cyber security tasks. According to the company, its users are given the tools they need to employ OSINT and publicly available data to secure people, property, and infrastructure by bridging the gap between the digital and physical worlds. Three main pillars serve as the foundation for the company's services — safety, usability and data breadth. When human safety and national security are on the line, speed to insight is the key. An emphasis on usability enables intelligence teams with a range of expertise and experience levels to be productive right away. Data breadth gives users a single point of access to all OSINT data at their disposal.

Hill & Associates Ltd, Innocent Lives Foundation, STS Government, Maletogo Technologies GmbH, and The Maritime Observatory are a few notable Echosec clients. This acquisition will increase Flashpoint's OSINT capabilities.

"Intelligence practitioners require a converged, user-focused solution that includes insights derived from both open and closed intelligence sources," Flashpoint president Donald Saelinger said in a statement.

GlobalFoundries is part of Google's open source silicon project now

GlobalFoundries (GF) has joined Google's open source silicon programme as a new partner, the company revealed in a blog post. Google has referred to the new cooperation as a milestone in the foundry ecosystem industry. The two companies are releasing the process design kit (PDK) for the GlobalFoundries 180MCU technology platform under the Apache 2.0 licence, along with a free silicon realisation programme to produce open source designs on the Efabless platform.

According to the blog, the partnership between GlobalFoundries and Google is a reinforcement of the sustainability of the open source strategy for the foundry ecosystem and will help drive innovation for application and silicon engineers. Google had earlier launched this collaboration alongside foundry service provider SkyWater Technologies. Over the course of two years, Google claims to have sponsored six shuttle flights, enabling the open source community to submit more than 350 original designs, of which about 240 were produced without charge.

The blog noted that due to the exceptional acceleration of digital capabilities, high-growth industries including mobile, IoT, and automotive now account for over 73 per cent of GF's foundry revenue. The company says applications using 180nm have a global capacity of 16+ million wafers per year at present, which is expected to reach 22+ million wafers in 2026.
