

NetBeans 6.7 features tighter integration with Project Kenai

Sun Microsystems and the NetBeans developer community have released NetBeans IDE 6.7. This new version of NetBeans features tight integration with Project Kenai, Sun's collaborative hosting site for free and open source projects. Developers can now download the free, full-featured NetBeans IDE 6.7 at www.netbeans.org. The tight integration of the new NetBeans IDE will enable developers to discuss, edit, debug and commit code through one easy-to-use interface. Other key features of NetBeans IDE 6.7 include: support for Maven, a community software project management and comprehension tool; the new 'Team' menu that provides access to projects on Kenai.com; and an automated continuous integration system with Hudson, an extensible Java-based solution that makes it easier for developers to integrate changes to their project, and makes it easier for users to obtain a fresh build. It also features improved PHP support allowing developers to connect with each other and the latest technologies; and support for Zemby, a single registry and repository of popular Web APIs.

Other highlights of the NetBeans IDE 6.7 release include improved PHP and GlassFish software support. The NetBeans IDE provides a rich set of features for Ruby, Groovy, JavaScript and other technologies. Support for JavaFX 1.2 technology is currently available for NetBeans IDE 6.5.1 and will soon be available for NetBeans IDE 6.7. Learn more at www.netbeans.org/features.

VirtualBox 3.0 introduces guest SMP support

Sun has released VirtualBox 3.0, a major update introducing Symmetrical Multiprocessing (SMP) in virtual machines as well as improved 3D support. The following major new features were also added: Guest SMP with up to 32 virtual CPUs (VT-x and AMD-V only); for Windows guests there is the ability to use Direct3D 8/9 applications/games (experimental); and support for OpenGL 2.0 for Windows, Linux and Solaris guests. Besides these, there are numerous other fixes and improvements. In fact, within 10 days of the initial 3.0.0 announcement, version 3.0.2 was released as a maintenance update with additional bug fixes. Read the latest changelog at www.virtualbox.org/wiki/Changelog.

Flash platform media, text frameworks now FOSS

Adobe has announced two new Adobe Flash Platform open source initiatives. Open Source Media Framework (OSMF), part of the project previously code named Strobe, enables developers to quickly and easily build feature-rich media players optimised for the Adobe Flash Platform. The Text Layout Framework (TLF) will help developers bring sophisticated typography capabilities to Web applications. Both OSMF and TLF are now freely available as open source software, helping content owners extend their online media efforts as they look to create new business opportunities and monetisation strategies to publish on the Web. For details, visit www.opensourcemediaframework.com.

Nmap 5.0 released

Insecure.Org has released Nmap Security Scanner version 5. This is the first major release since the 4.50 release in 2007. Some improvements in Nmap 5, according to the developers, include: the new Ncat tool aims to be your Swiss army knife for data transfer, redirection, and debugging; the addition of the Ndiff scan comparison tool makes it easy to automatically scan your network daily and report on any changes (systems coming up or going down, changes to the software services they are running, etc); the developers have spent the last summer scanning much of the Internet and merging that data with internal enterprise scan logs to determine the most commonly open ports—this allows Nmap to scan fewer ports by default while finding more open ports.
