

Greg K-H is the current Linux kernel maintainer for the -stable branch and is well known for his contributions to the Linux device drivers project that has enabled the kernel to support the MOST number of hardware devices, compared to any other kernel or OS. Here we present a quick interview with the man.

A Quick Q 'n' A Session with Greg Kroah-Hartman

Q What was your first computer?

My first computer was a Radio Shack TRS-80, Model 3.

Q What was the first piece of code that you wrote?

I learned and wrote programs in BASIC for that first machine, some of which ended up being used by my parents for different volunteer tasks they were involved in at the time.

Q How did you come into contact with the FOSS folks, and how did that journey start?

I came in contact with the code before the people :-). The first large gathering of open source people I met was at the first Linux Kernel summit back in 2001. That was the first time a large group of Linux kernel developers had got together in one place. It was very good, and spawned a number of projects that ended up in the kernel, as well as created a number of good friendships that still are ongoing.

Q What does Greg K-H do when he is not coding :-)

Play with my kids, pull weeds from my garden, snowboard in the winter. Normal family stuff :-)
